

Hepdata: My ATLAS perspective

Bill Murray

STFC-RAL / University of Warwick

bill.murray@stfc.ac.uk

24th November 2017

- What works well?
- What could be better?

HepData usage

- ATLAS is a big user
 - See table right
- And a satisfied customer
 - At the 'ATLAS new physics search reinterpretation workshop' in July the talk 'What to we already do for SUSY' has the word 'hepdata' in large font in top left on 13/19 slides.
 - And argues the approach works
 - "Everyone agrees hepdata is fantastic and we should use it for everything under the sun"
 - Exotics and Higgs less developed, but same idea
 - Desire to make publishing analysis easier
 - But SUSY seem happy with code use
 - Debate on full/simplified likelihoods

| | |
|-----------|-----|
| ATLAS | 346 |
| CMS | 220 |
| CDF | 209 |
| ZEUS | 169 |
| ALICE | 164 |
| H1 | 146 |
| OPAL | 145 |
| D0 | 127 |
| L3 | 112 |
| DELPHI | 101 |
| ALEPH | 83 |
| CLEO | 67 |
| TASSO | 65 |
| LHCB | 59 |
| THE ATLAS | 1 |

Data entry: much improved

- Personal comment: some of the support tables uploaded to hepdata are not so well scrutinised
 - They are not well scrutinised in experiment review
 - Mistakes do happen
 - The visualisation tools are very useful
- But this is much improved.

Lets explore this one

HepData Link clear (usually)

www.hepdata.net/record/80080

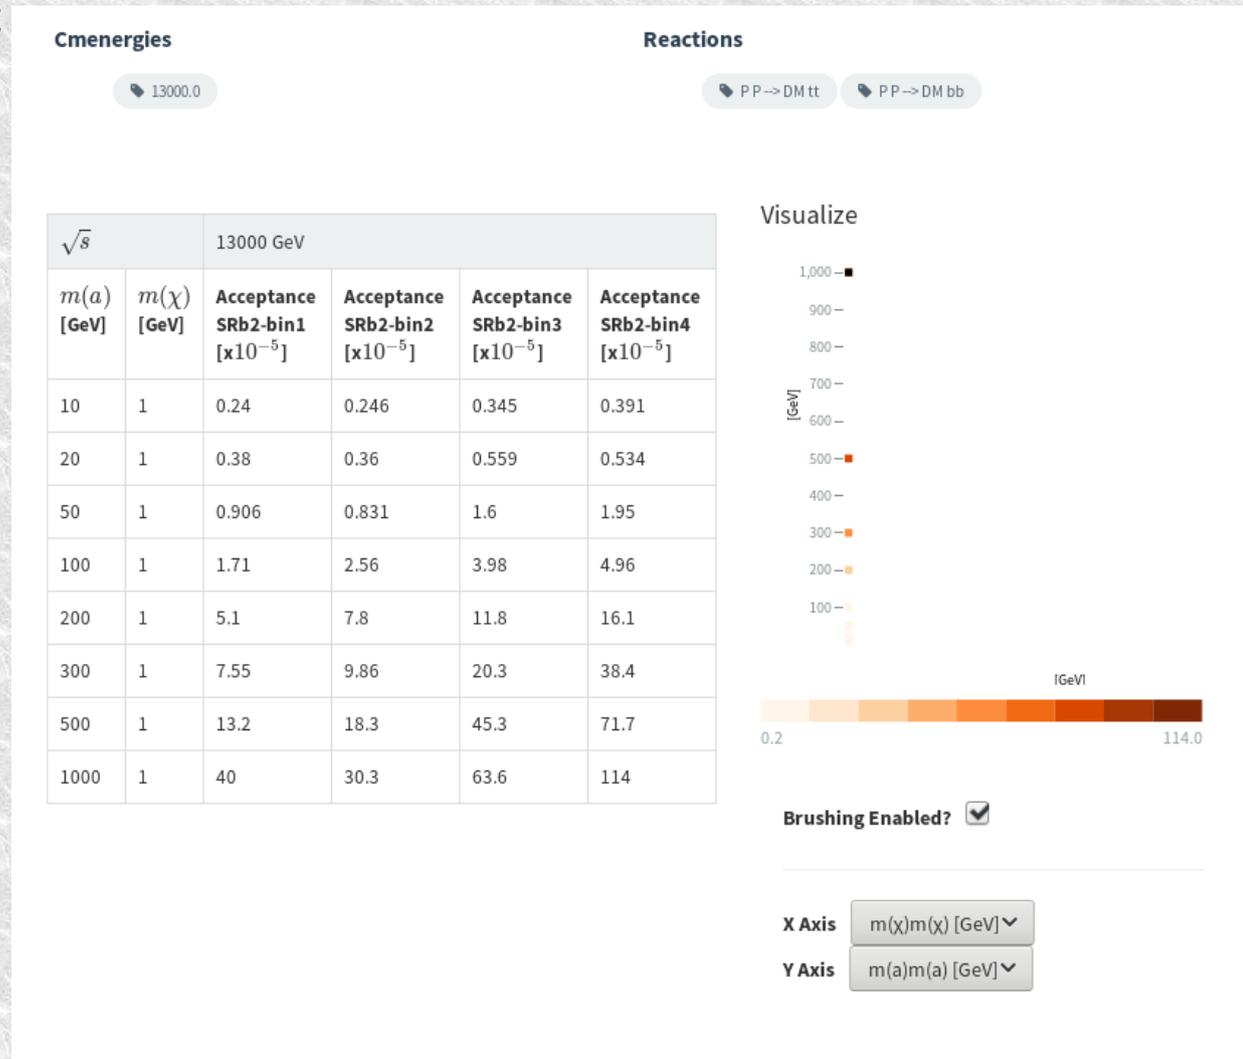

- “Search for dark matter produced in association with bottom or top quarks in $\sqrt{s} = 13$ TeV pp collisions with the ATLAS detector”
- Record clear, well laid out
- 63 data tables in this example
 - Cut flows
 - Efficiencies
 - Results plots
 - (I am used to errors on data but that’s philosophy)
- Very nice
- Sometimes WWW hangs when a table is requested
 - OK, ask again

Example: poor table

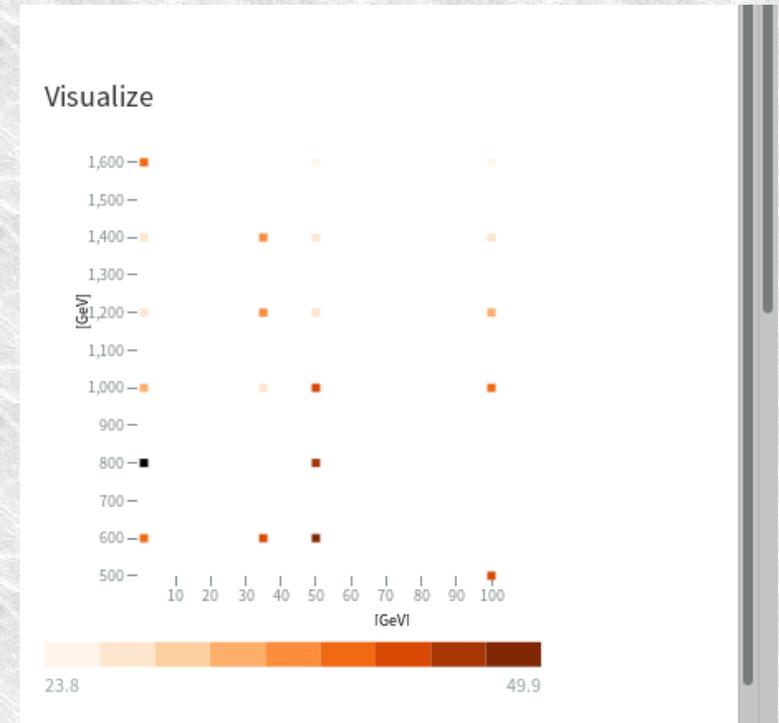

Sometimes automatic binning of tabular data makes unhelpful choice

- Here it would be nice to be able to separate the columns
- This is nit-picking

Example dubious data

- A table from this paper
- Table 40: “Data from table 19, Efficiency of the SRb1 selection of the b-FDM model signal samples
- This particular table seems to me either
 - Structure meaningful?
 - Insufficient granularity
 - Structure reflects MC stats?
 - Not given - unhelpful
 - Wrong
- But it reflects perfectly what ATLAS supplied

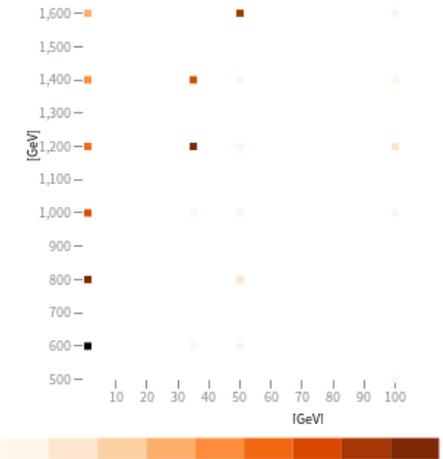

Example wrong data

- A table from this paper
- Table 39: “Data from table 19, Efficiency of the SRb1 selection of the b-FDM model signal samples
- This table is simply wrong
- (600,50) is a factor 100 different between ATLAS and HepData table
 - And some others too

| \sqrt{s} | 13000 GeV | |
|-------------------|-----------------|---------------------------------------|
| $m(\phi_b)$ [GeV] | $m(\chi)$ [GeV] | Acceptance. SRb1 [$\times 10^{-4}$] |
| 600 | 1 | 9.19 |
| 800 | 1 | 9.17 |
| 1000 | 1 | 5.32 |
| 1200 | 1 | 3.7 |
| 1400 | 1 | 2.71 |
| 1600 | 1 | 2.29 |
| 600 | 50 | 0.265 |
| 800 | 50 | 0.527 |

Visualize

| $m(\phi_b)$ [GeV] | $m(\chi)$ [GeV] | acc. SRb1 | eff. SRb1 |
|-------------------|-----------------|----------------------|----------------------|
| 600 | 1 | $9.19 \cdot 10^{-4}$ | $4.01 \cdot 10^{-1}$ |
| 800 | 1 | $9.17 \cdot 10^{-4}$ | $4.99 \cdot 10^{-1}$ |
| 1000 | 1 | $5.32 \cdot 10^{-4}$ | $3.53 \cdot 10^{-1}$ |
| 1200 | 1 | $3.70 \cdot 10^{-4}$ | $3.06 \cdot 10^{-1}$ |
| 1400 | 1 | $2.71 \cdot 10^{-4}$ | $2.83 \cdot 10^{-1}$ |
| 1600 | 1 | $2.29 \cdot 10^{-4}$ | $3.91 \cdot 10^{-1}$ |
| 600 | 50 | $2.65 \cdot 10^{-3}$ | $4.70 \cdot 10^{-1}$ |
| 800 | 50 | $5.27 \cdot 10^{-3}$ | $4.55 \cdot 10^{-1}$ |
| 1000 | 50 | $3.41 \cdot 10^{-3}$ | $4.22 \cdot 10^{-1}$ |
| 1200 | 50 | $1.83 \cdot 10^{-3}$ | $3.00 \cdot 10^{-1}$ |

ATLAS ongoing

- ATLAS task force
 - Reps from all physics groups
- New ATLAS guidelines/tips twiki
 - How to use
 - What to store
 - Pitfalls
- Currently Hepdata upload timing varies with physics group
 - Recommendation to to in parallel with submission to Archive
 - Change after journal review if necessary
- HepData should go hand in hand with Rivet
 - Still in discussion

Preliminary Recommendations

What to put to HEPData

- General: Everything that is useful for a theoretician, i.e. all final results (also tables which are already in the paper)
- **Measurements**
 - Fiducial Definition
 - Measured values / cross-sections and uncertainties
 - Correlations
 - Correlation matrices
 - Effect of each systematic separately
 - Measurement variations
 - Correction factors between particle-level definitions
- **Searches**
 - model dependent limits (table of expected +/- 1, 2 sigma, observed limits vs mass)
 - model independent limits (table of observed limits vs mass)
 - acceptance / efficiency vs mass (or whatever other variable is relevant)
 - final distribution if it is useful: data counts, total background yield, statistical error on the background, systematic error on the background

ATLAS Request:

- HEPData is in pretty good shape.
- One thing bothers us:
 - Implementing a review process for the HEPData entries before the publication:
 - i.e. each ATLAS author can check what we put into HEPData before we publish the entry.
 - Could use CDS for this, where the HEPData tar-file could be stored. This requires that an ATLAS member downloads this file, and uploads it to his private HEPData Sandbox. There are two issues:
 - The Sandbox link can be seen by everybody, when known - it would be better to have a “real” private version
 - The procedure is quite complicated, since it involves one download and one upload. It would be somehow good, if the HEPData access could be linked somehow to the CDS access rights...
- Can HEPData access use CERN CDS rights?
