Vector Boson Scattering in 60 Seconds

- SM cross-section violates unitarity at $\sim 1\text{TeV}$
- Extra Higgs diagrams can save you
- Or something else
 - More extra particles
 - Weirder things...
 - Fairly model independent
 - Interesting even with light Higgs

Experimental Signature

- Can study ZZ , WZ or WW
- UCL working on WW in semi-leptonic mode
 - 1 highly boosted hadronic W (1 or 2 central jets)
 - 1 leptonic W (1 isolated lepton and missing E_t)
 - 2 “tag” jets in the forward region
- Reach is new particles around $500\text{GeV} - 1\text{TeV}$
- W +jets and $t\bar{t}$ are the main backgrounds

Can Study

- Cross-section (starting with upper limit)
- Invariant mass distribution for resonances
- Eventually even spin of resonance

Cuts in Brief

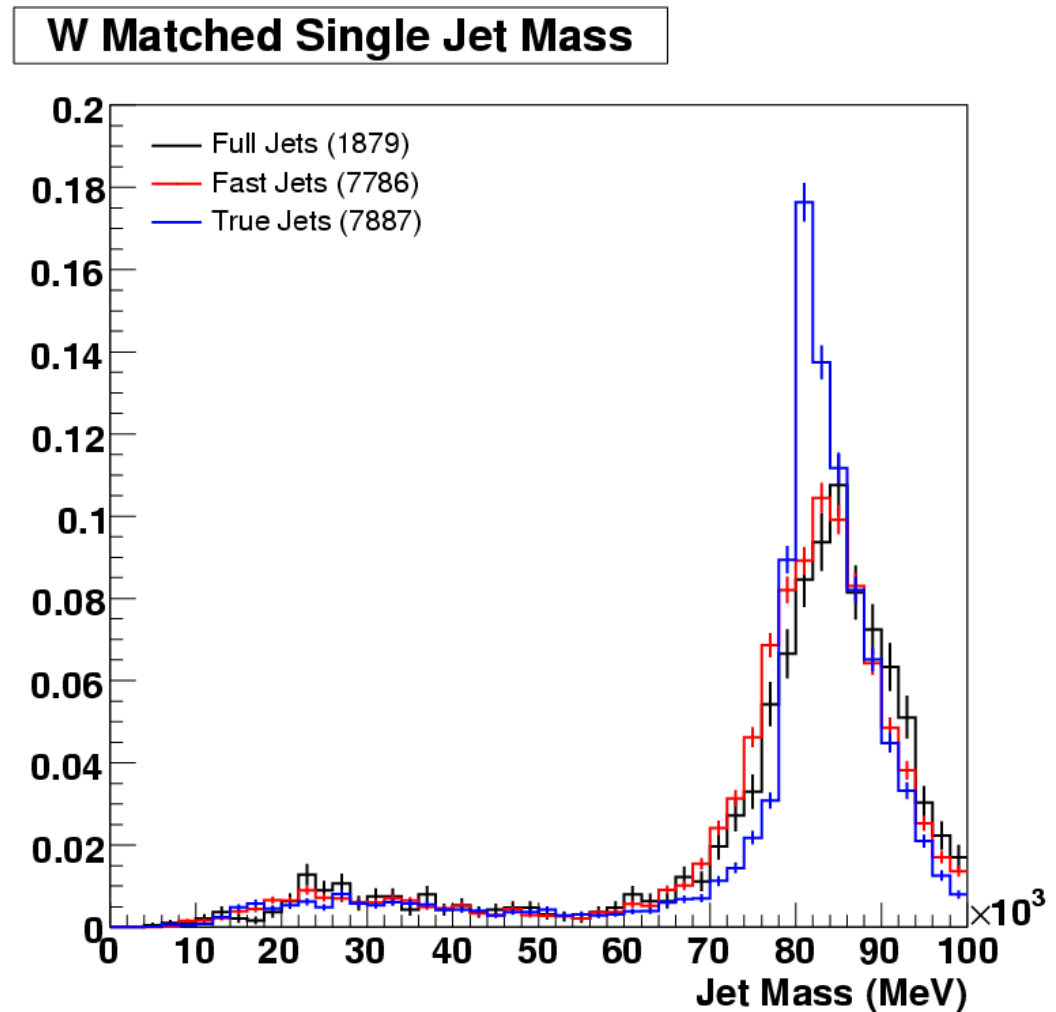

- Hadronic W Candidate (more later) $p_t > 200\text{GeV}$
- Leptonic W Candidate $p_t > 200\text{GeV}$
- Both central ($|\eta| < 2$)
- 1 forward and 1 backward tag jet
- Top-veto
- Central jet veto

Hadronic W Candidate

- Most challenging part of analysis
- W is often highly boosted, decays as 1 jet
- Can't use dijet mass window but still need to be able to identify W's vs much more prevalent QCD jets ...
- For lower pt, still fall back to “classic” 2 jet scenario

Single Jet Mass

- First weapon is to measure mass of the single jet
- Analogous to dijet mass
- Can apply window

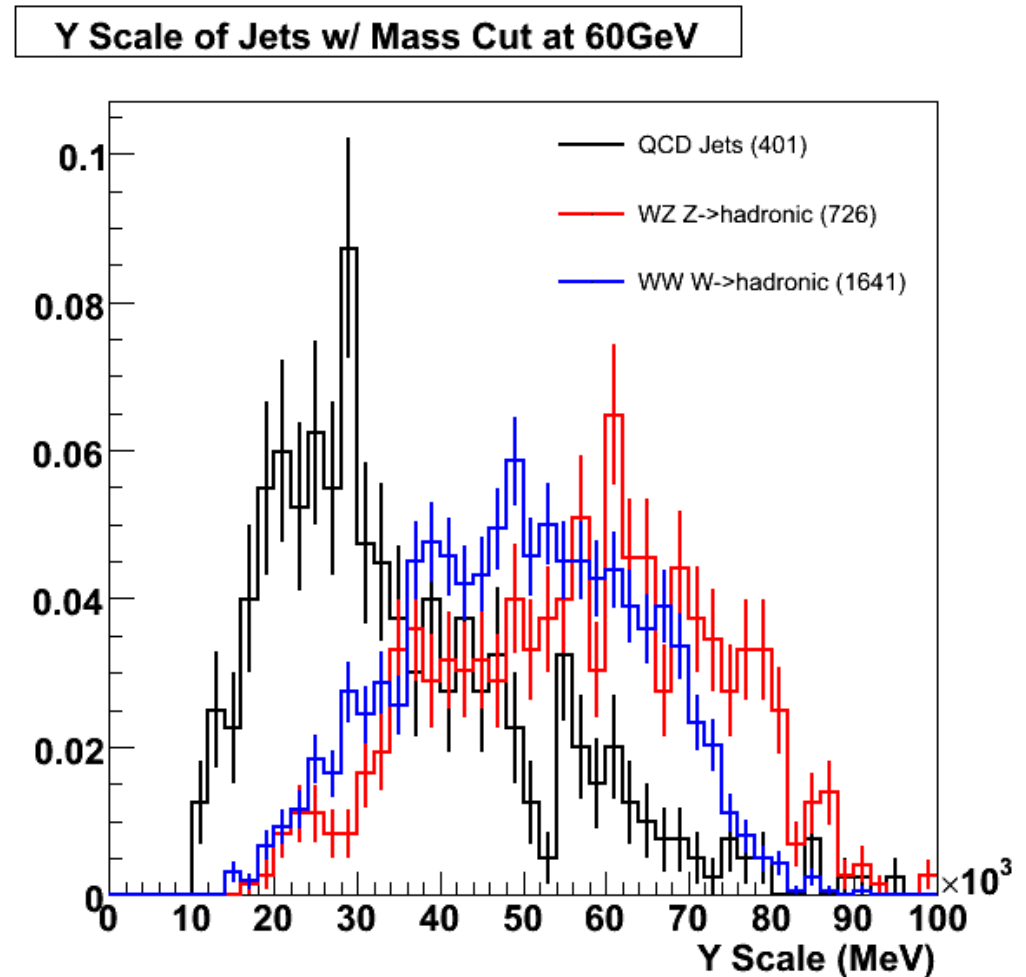

YSplitter

- Try to figure out if high mass is due to genuine hard splitting or just sum of many small masses
- Our jet of choice is $K_t 0.6$
- Take clustered K_t jet and go backwards
- K_t distance of final splitting gives y -scale
 - Scale at which jet can be resolved into two subjects

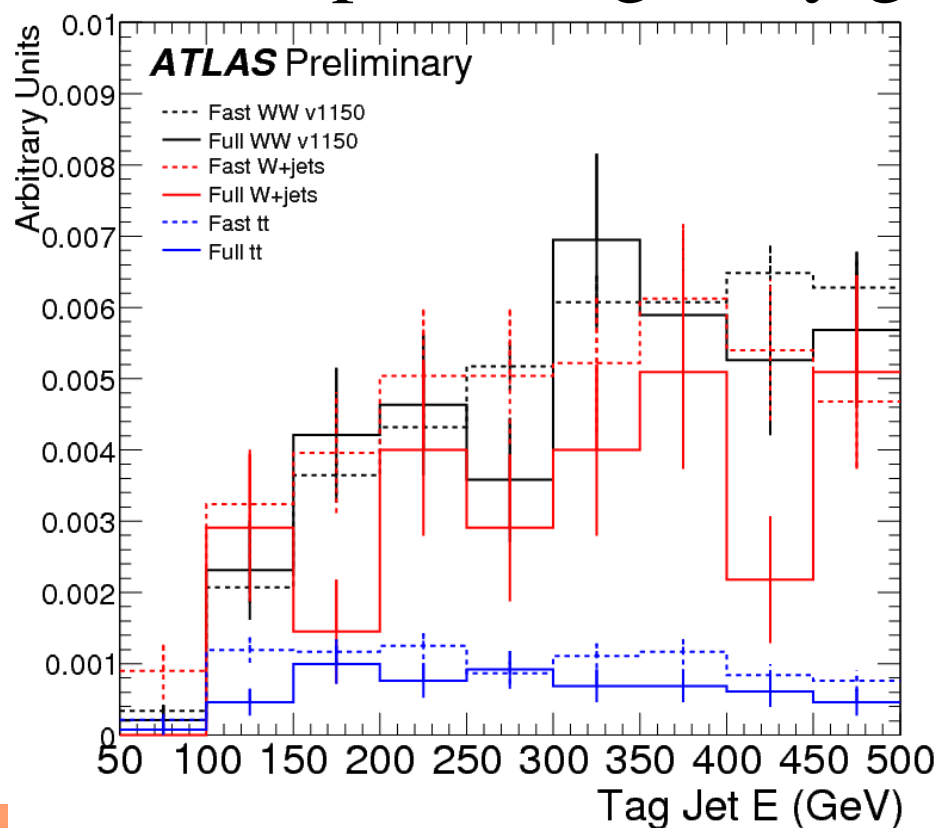

More YSplitter

- Factor of 2-3 better than single jet mass alone in signal-to-background ratio

Forward Jets

- $|\eta_{\text{jet}}| > 2$ and $p_{\text{T}} > 20\text{GeV}$ and $E_{\text{highest}} > 300\text{GeV}$
- Still optimising, may go for delta eta in the end

Monte Carlo Studies

- Various studies carried out
- For example, comparison of Alpgen and **Madgraph** for W+jets background

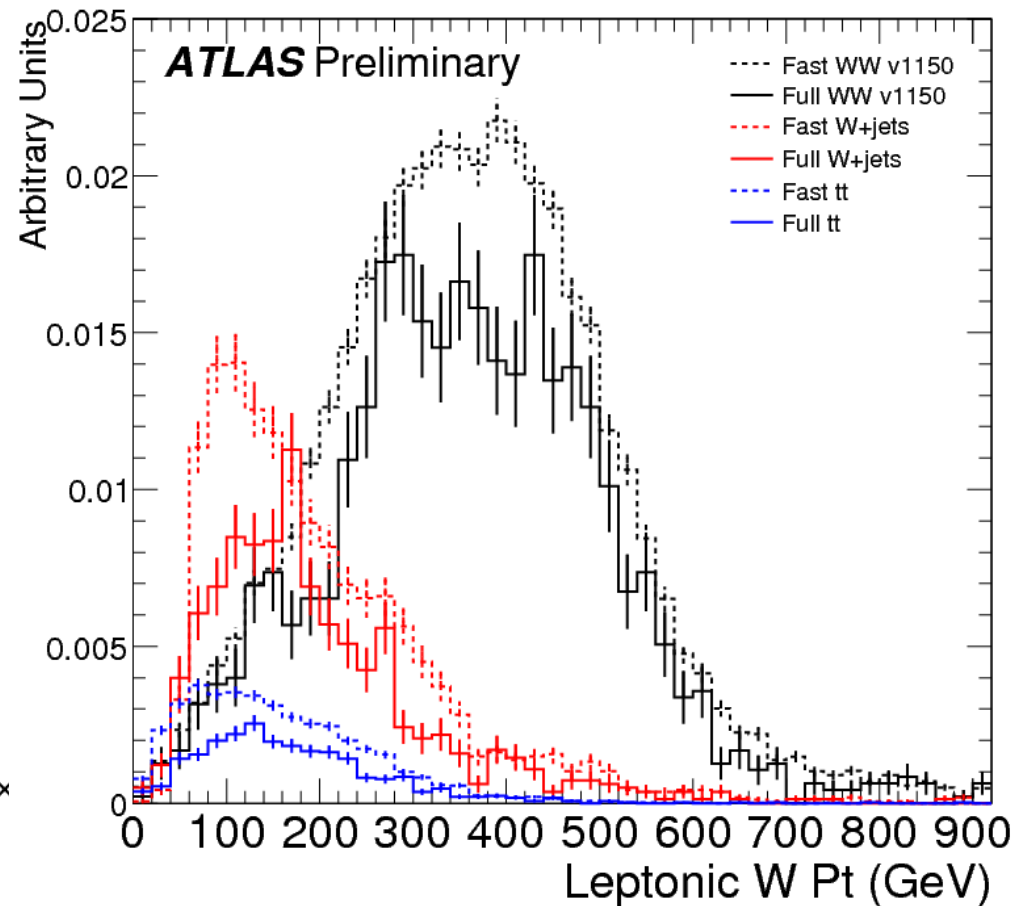

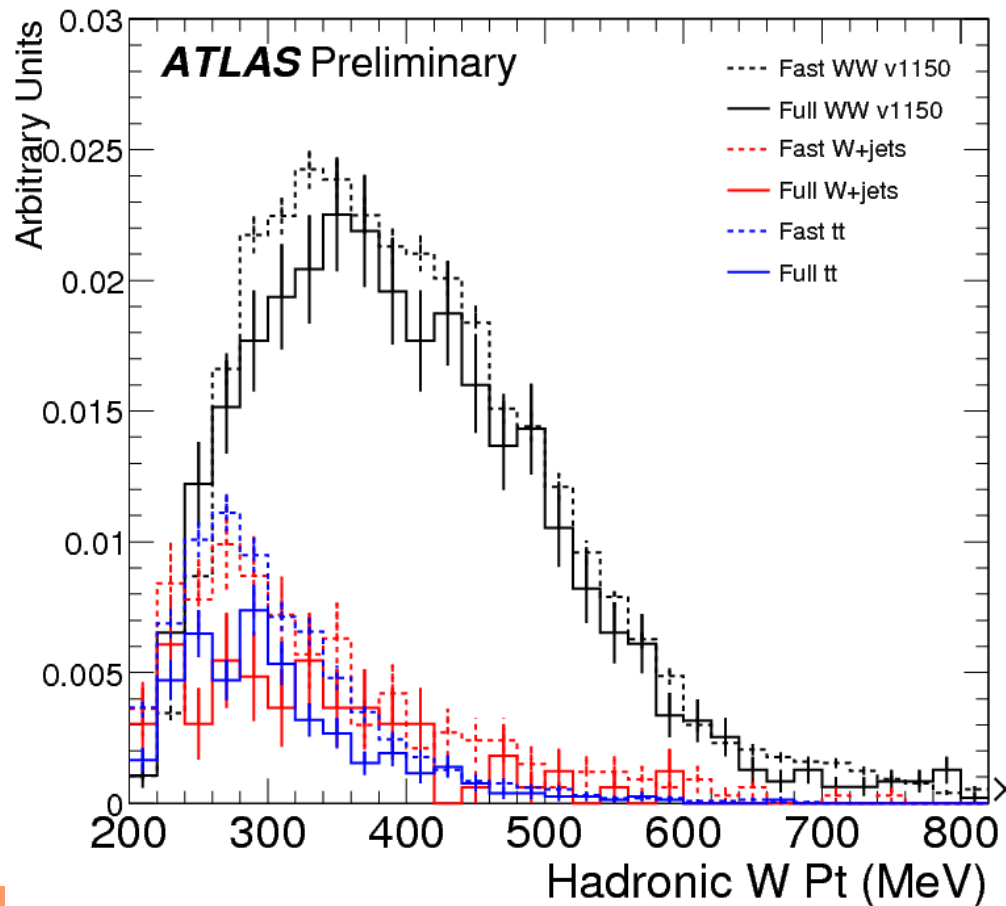

Trigger

- Not particularly challenging for us
- Can take Lepton OR xEt OR Jet
- Well above thresholds for all but jets
- End up at $>99\%$
- Black is jet160
- Blue jet160 || 2jet120

Working with Atlfast

- Only problem is lack of lepton efficiencies

Grid

- Same as everyone else
- Managed to do majority of our work on the grid
 - Used both GANGA and pathena

Sample of (Preliminary) Results

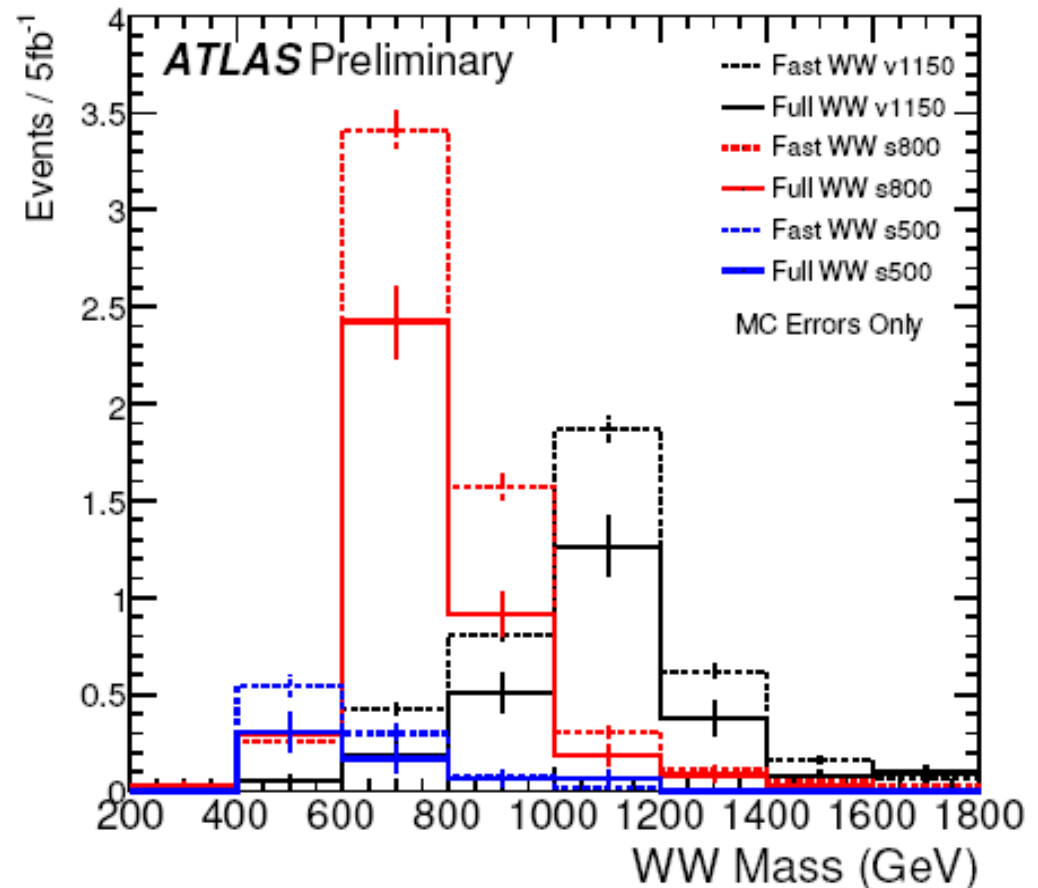

| Cut | Reconstruction Efficiency (%) | Trigger Efficiency (%) | Signal σ (fb) | $t\bar{t}$ σ (fb) | $W + \text{Jets}$ σ (fb) | Sig/B |
|----------------------------------|-------------------------------|------------------------|----------------------|--------------------------|---------------------------------|-------|
| Starting sample generated | – | – | (28) | 249000 | 37000 | |
| $\equiv 1$ Hadronic W | 28.4 ± 0.5 (32) | | (9.0) | 3100 (3700) | (644) | |
| $\equiv 1$ Leptonic W | 54 ± 1 (73) | | (6.6) | 1400 (1700) | (294) | |
| p_T (Had. W) > 200 GeV | 99.9 ± 0.1 (100) | | (6.6) | 1300 (1700) | (290) | |
| $ \eta $ (Had. W) < 2 | 96.3 ± 0.5 (96) | | (6.3) | 1200 (1500) | (220) | |
| p_T (Lep. W) > 200 GeV | 92 ± 1 (92) | | (5.8) | 400 (600) | (120) | |
| $ \eta $ (Lep. W) < 2 | 96 ± 1 (95) | | (5.5) | 400 (500) | (86) | |
| $\equiv 2$ tag jets | 45 ± 1 (51) | | (2.8) | 20 (100) | (25) | |
| $\equiv 0$ top candidates | 49 ± 2 (41) | 99 ± 1 | (1.2) | < 20 (< 10) | (6.3) | |

Table 16: Efficiencies of the cuts for the 800 GeV resonant $qqWW \rightarrow qq\ell\nu qq$ sample. The trigger efficiency column shows the efficiency of mu20i || e25i || jet160 signatures on the sample after each of the cuts have been consecutively applied.

Uh oh...

An Example Invariant Mass Spectrum

- Rather unoptimised
- Single Jet mode only
(not good for 500GeV)
- Event counts low

Status of CSC Note

- Collaborating with WZ analysis at Montreal
- Need to do some optimization before it's final
- But unless we live in a model with a very high WW scattering cross-section then measurement probably not possible with CSC lumi ($< 5\text{fb}^{-1}$)
- Early data will realistically be used for calibration and background study, especially single jet mass

What's Going On?

- Trying to finish CSC note
- Working on analysis software
 - Was EventView this time
 - Still evaluating what post-CSC analysis will use
- Working closely with Jet performance group
 - Gradually working YSplitter upstream
 - By release 14, might be getting there

Summary

- WW scattering is interesting
- CSC note is drafted
- Now in optimization/editing phase
- Will have something done by the CSC deadline
- Now looking toward post-CSC work
- YSplitter hopefully fully integrated by release 14

Veto

- Top Veto
 - Reco W candidates with any jet
 - Do leptonic and hadronic
 - Window is 130-240GeV
- Central Jet Veto
 - No jets with $pt > 50\text{GeV}$ in $|\eta| < 2$
 - Obviously except for W candidate jet

Had W Cuts

- Y window is 35-100 GeV
- Mass window is centred at 82.8 GeV, allow 14.4 GeV each side (2 sigma)
