# $U(1)_A$ breaking in hot QCD in the chiral limit

#### Tamás G. Kovács

Eötvös Loránd University, Budapest, Hungary and Institute for Nuclear Research, Debrecen, Hungary

Partly based on TGK, PRL 132 (2024) 131902

Lattice '24, Liverpool, August 3, 2024

## Symmetries of QCD and their realization

- partition function  $Z = \int \mathcal{D}U \prod_f \det(D[U] + m_f) \cdot e^{-S_g[U]}$
- $m_{\rm u} \approx m_{\rm d} \approx 0$
- Symmetries:  $SU(2)_{V} \times SU(2)_{A} \times U(1)_{V} \times U(1)_{A}$ 
  - U(1)<sub>A</sub> anomalous
  - SU(2)<sub>A</sub> spontaneously broken below T<sub>c</sub>
- Order parameter of SU(2)<sub>A</sub> (Banks-Casher formula):

$$\langle \bar{\psi}\psi \rangle \propto \frac{1}{V} \sum_{i} \frac{1}{\lambda_{i} + m} \propto \int_{-\Lambda}^{\Lambda} d\lambda \frac{m}{\lambda^{2} + m^{2}} \rho(\lambda) \xrightarrow{m \to 0} \rho(0)$$

 $\lambda_i$ : eigenvalues of the Dirac operator,  $\rho(\lambda)$ : its spectral density

### The finite temperature transition

#### Standard picture

#### Below $T_c$

- Chiral symmetry broken
- Order parameter:  $\rho(0) \neq 0$

## The finite temperature transition

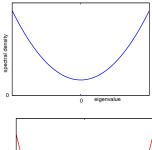

#### Standard picture

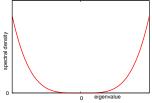

#### Below $T_c$

- Chiral symmetry broken
- Order parameter:  $\rho(0) \neq 0$

#### Above $T_c$

- Chiral symmetry restored
- Order parameter  $\rho(0) = 0$
- (Pseudo)gap (lowest Matsubara mode)

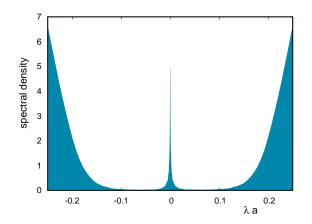

spectral density at 0  $\iff$  realization of chiral symmetry

### Spectral density at $T = 1.1 T_c$ on the lattice

quenched, overlap spectrum, exact zero modes removed

#### Peak at zero in the spectral density!

Edwards et al. PRD 61 (2000); Alexandru and Horvath, PRD 92 (2015); Alexandru et al. 2404.12298

Kaczmarek, Mazur, Sharma, PRD 104 (2021); Kaczmarek, Shanker, Sharma, PRD 108 (2023)

#### Questions

• Why is there a peak at zero?

• How is it suppressed if the quark determinant is included?

• How does the peak influence chiral symmetry as  $m \rightarrow 0$ ?

## Instantons $\rightarrow$ zero eigenvalues of D(A)

- (Anti)instanton
  - $\rightarrow$  zero eigenvalue of D(A) with (-)+ chirality eigenmode
- High T: large instantons "squeezed out" in the temporal direction
   → dilute gas of instantons and antiinstantons
- Zero modes exponentially localized:

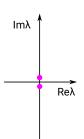

$$\psi(r) \propto e^{-\pi Tr}$$

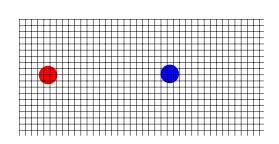

The Dirac operator in the subspace of zero modes

$$D(A) = \left(\begin{array}{cc} 0 & iw \\ iw & 0 \end{array}\right)$$

$$w \propto e^{-\pi Tr}$$

### Spectrum of D(A)

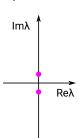

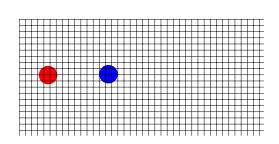

The Dirac operator in the subspace of zero modes

$$D(A) = \left(\begin{array}{cc} 0 & iw \\ iw & 0 \end{array}\right)$$

$$w \propto e^{-\pi Tr}$$

### Spectrum of D(A)

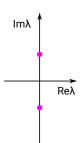

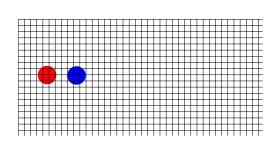

The Dirac operator in the subspace of zero modes

$$D(A) = \left(\begin{array}{cc} 0 & iw \\ iw & 0 \end{array}\right)$$

$$w \propto e^{-\pi Tr}$$

### Spectrum of D(A)

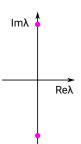

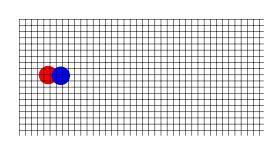

The Dirac operator in the subspace of zero modes

$$D(A) = \left(\begin{array}{cc} 0 & iw \\ iw & 0 \end{array}\right)$$

$$w \propto e^{-\pi Tr}$$

### Spectrum of D(A)

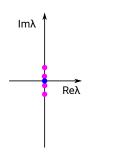

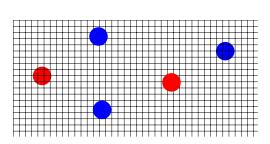

# Spectrum of D(A) in dilute gas of instantons

The Dirac operator in the subspace of zero modes

#### Spectrum of D(A)

#### Instantons and antiinstantons

#### $n_i$ instantons $n_a$ antiinstantons

 $\rightarrow$   $|n_i - n_a|$  exact zero modes + mixing near zero modes

## Dirac operator in the subspace of zero modes (ZMZ)

Work by E.V. Shuryak, J.J.M. Verbaarschot, T. Schäfer (1990-2000)...

- Given  $n_i$  instantons,  $n_a$  antiinstantons in 3d box of size  $L^3$
- Construct  $(n_i + n_a) \times (n_i + n_a)$  matrix:

$$D = \begin{pmatrix} & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ \end{pmatrix}$$

•  $w_{ii} = A \cdot \exp(-\pi T \cdot r_{ii}),$ 

 $r_{ii}$  is the distance of instanton i and antiinstanton j.

### Random matrix model of D(A) in the zero mode zone

- How to choose instanton numbers  $(n_i, n_a)$  and locations?
- Quenched lattice  $T > 1.05T_c \rightarrow$  free instanton gas

Bonati et al. PRL 110 (2013); Vig and TGK, PRD 103 (2021)

n<sub>i</sub> and n<sub>a</sub> independent identical Poisson-distributed

$$p(n_i, n_a) = e^{-\chi V} \cdot \frac{(\chi V/2)^{n_i}}{n_i!} \cdot \frac{(\chi V/2)^{n_a}}{n_a!}$$

 $\chi$  is the topological susceptibility

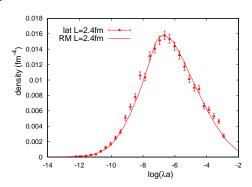

- Locations random (uniform)
- ◆ D(A) in quenched QCD: ensemble of random matrices

# Fit parameters to quenched lattice Dirac spectrum

 $T = 1.1 T_c$  overlap Dirac spectrum

- Two parameters:
  - $\chi$  topological susceptibility: from exact zero modes  $\to \chi = \langle Q^2 \rangle / V$
  - A prefactor of the exponential mixing between zero modes
- Fit A to distribution of Dirac eigenvalues

lowest eigenvalue; L = 2.4fm fit

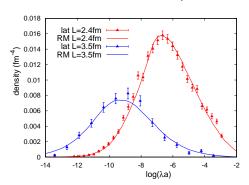

# Fit parameters to quenched lattice Dirac spectrum

 $T = 1.1 T_c$  overlap Dirac spectrum

- Two parameters:
  - $\chi$  topological susceptibility: from exact zero modes  $\rightarrow \chi = \langle Q^2 \rangle / V$
  - A prefactor of the exponential mixing between zero modes
- Fit A to distribution of Dirac eigenvalues

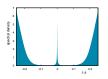

lowest eigenvalue; L = 2.4 fm fit L = 3.5 fm prediction

### Random matrix model of full QCD zero mode zone

• Include  $\det(D+m)^{N_f}$  in Boltzmann weight

Bulk weakly correlated with zero mode zone

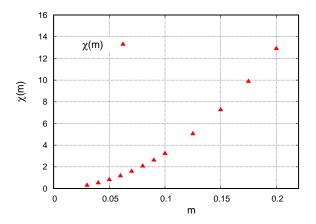

- Approximate det with  $\prod_{j=1,\dots,m} (\lambda_j + m)$
- Consistently included in RM model:

$$P(n_{i},n_{a}) = e^{-\chi_{0}V} \frac{1}{n_{i}!} \frac{1}{n_{a}!} \left(\frac{\chi_{0}V}{2}\right)^{n_{i}+n_{a}} \times \det(D+m)^{N_{f}}$$

free instanton gas with random locations

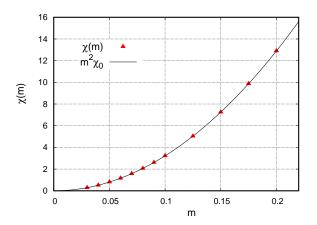

### Random matrix simulation: results for $N_f = 2$

#### Topological susceptibility:

### Random matrix simulation: results for $N_f = 2$

Topological susceptibility: 
$$\chi(m)=m^2\chi_0$$
 not a fit!  $\uparrow$  quenched susceptibility

### Explanation: free instanton gas

• Quark determinant for  $n_i$  instantons and  $n_a$  antiinstantons:

$$\det(D+m)^{N_f} = \prod_{n_i,n_a} (\lambda_i + m)^{N_f} \approx m^{N_f(n_i + n_a)}$$

$$\text{if } |\lambda_i| \ll m$$

 Reweighting depends on number of topological objects, not on their type or location

$$P(n_i, n_a) \propto \left(\frac{\chi_0 V}{2}\right)^{n_i + n_a} \times \det(D + m)^{N_f} \approx \left(\frac{m^{N_f} \chi_0 V}{2}\right)^{n_i + n_a}$$

- Free gas, but susceptibility suppressed as  $\chi_0 o m^{N_{\rm f}} \chi_0$
- As  $m \to 0$  instanton gas more dilute  $\Rightarrow |\lambda_i|$  smaller
- Even in the chiral limit  $|\lambda_i| \ll m \implies$  free instanton gas

### Spectral density singular at the origin for $V \to \infty$

RM model simulation, parameters from quenched  $T = 1.1 T_c$  overlap spectrum

$$ho(\lambda) \propto \lambda^{\alpha}$$
 fit:  $\alpha = -0.770(5)$ 

Banks-Casher for a singular spectral density?

## "Banks-Casher" for singular spectral density

$$\langle \bar{\psi}\psi \rangle \propto \langle \sum_{i} \frac{m}{m^{2} + \lambda_{i}^{2}} \rangle \approx \underbrace{\begin{pmatrix} \text{avg. number of in-} \\ \text{stantons in free gas} \end{pmatrix}}_{m^{N_{f}} \chi_{0} V} \times \frac{1}{m} = m^{N_{f}-1} \chi_{0} V$$

$$|\lambda_{i}| \ll m$$

# "Banks-Casher" for singular spectral density

$$\langle \bar{\psi}\psi \rangle \propto \langle \sum_{i} \frac{m}{m^{2} + \lambda_{i}^{2}} \rangle \approx \underbrace{\begin{pmatrix} \text{avg. number of in-} \\ \text{stantons in free gas} \end{pmatrix}}_{m^{N_{f}}\chi_{0}V} \times \frac{1}{m} = m^{N_{f}-1}\chi_{0}V$$

$$|\lambda_{i}| \ll m$$

 $U(1)_A$  breaking susceptibility  $\chi_{\pi} - \chi_{\delta}$ 

$$\langle \sum_{i} \frac{m^2}{(m^2 + \lambda_i^2)^2} \rangle \approx \underbrace{\left( \frac{\text{avg. number of in-}}{\text{stantons in free gas}} \right)}_{m^{N_{\text{f}}} \chi_0 V} \times \frac{1}{m^2} = m^{N_{\text{f}} - 2} \chi_0 V$$

$$\rightarrow \lim_{m \to 0} (\chi_{\pi} - \chi_{\delta}) \neq 0 \qquad \text{for } N_f = 2$$

### Direct lattice simulations?

- Important to resolve small Dirac eigenvalues
  - → chiral action needed JLQCD, PRD 103 (2021)
- To see spectral peak: large volume, close to T<sub>c</sub> needed
- $\frac{\chi_{\pi} \chi_{\delta}}{\chi_{\text{top}}} \propto m^{-2}$  instanton contribution independent of T
- Explore how far down in T free instanton gas persists
  - Compare eigenvalue statistics to prediction of free instanton gas
  - Can be done in each topological sector separately

## Related developments & outlook $T \gtrsim T_c$

- RM model @ small  $m \to {\rm instanton}$ -antiinstanton molecules do not contribute to  $\langle \bar{\psi} \psi \rangle$  and  $\chi_\pi \chi_\delta$  in the chiral limit TGK, PRL 132 (2024)
- Constraints on the Dirac spectrum from chiral symmetry restoration Giordano, 2404.03546 (2024), + talk on Monday
   → consistent with free instanton gas
- Localization properties of eigenmodes in ZMZ

```
Giordano and TGK, Universe 7 (2021)

Alexandru and Horvath, PRL 127 (2021), PLB 833 (2022)
```

Possible new "phase" of QCD just above T<sub>c</sub>

```
Alexandru and Horvath, PRD 100 (2019); Glozman, Prog.Part.Nucl.Phys. 131 (2023) spatial structure (dim) of low eigenmodes very different @ T \gtrsim T_c and T \gg T_c _{\chi}QCD and CLQCD, 2305.09459; Pandey, Shanker, Sharma, 2407.09253
```

Lots to be explored!

#### Conclusions

- At high T non-interacting degrees of freedom: free instantons (+ IA molecules)
- Dirac spectral density has singular peak at zero at any finite T, for any nonzero quark mass
- Chiral symmetry restoration nontrivial

 $\rightarrow$   $N_f = 2$ : anomaly remains

- $SU(2)_{\rm A}$  restored, but order of the  $m \to 0$  and  $V \to \infty$  limit is still important
- Chiral limit with N<sub>f</sub> degenerate light quarks:
  - $\langle \bar{\psi}\psi \rangle \propto m^{N_{\rm f}-1}$

agrees with small m expansion of the free energy

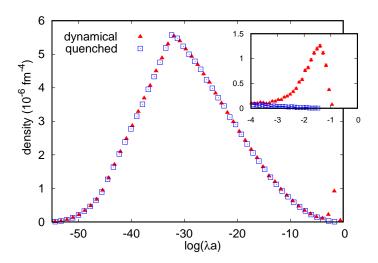

Kanazawa and Yamamoto, PRD 91 (2015), JHEP 01 (2016)

• 
$$\chi_{\pi} - \chi_{\delta} \propto m^{N_{\rm f}-2}$$
