Results previous talk: differential decay rate from lattice observables

Γ_{cd} is Cabibbo suppressed

Results previous talk: differential decay rate from lattice observables

This talk:

- Finite Size Effects
- Continuum Limit
- $\sigma \mapsto 0$ extrapolation
- Integration over q^2
- Comparison with experiments

Introduction

- Semileptonic Inclusive Decay of the D_s
- inclusive decay is an inverse problem
- ill-posed-problem, solved with HLT method [HLT19]
- preliminary investigation [Gam+22; GH20]
- theoretical details, applications in talk by Alessandro De Santis
- inclusive and exclusive do not agree in B-decays

Experimental results

BESIII
 $D_s^+ \rightarrow X e^+ \nu_e$
 fit to determine
 low momenta

BESIII [Abl+21] $\Gamma = (8.27 \pm 0.17 \pm 0.12 \pm 0.06) \times 10^{-14} \text{ GeV}$

CLEO-C [Asn+10] $\Gamma = (8.56 \pm 0.51 \pm 0.20) \times 10^{-14} \text{ GeV}$

Γ_{fg} from lattice QCD

We need the hadronic tensor which is the **spectral density** of the correlation function

$$M_{fg}^{\mu\nu}(t, \mathbf{q}^2) = \int_0^\infty dq_0 H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2) e^{-q_0 t}$$

that in practice is obtained by

$$M_{fg}^{\mu\nu}(t_2 - t_1, \mathbf{q}^2) = \lim_{\substack{t_{\text{snk}} \mapsto +\infty \\ t_{\text{src}} \mapsto -\infty}} \frac{C_{4\text{pt}}^{\mu\nu}(t_{\text{snk}}, t_2, t_1, t_{\text{src}}; \mathbf{q})}{C_{2\text{pt}}(t_{\text{snk}} - t_2) C_{2\text{pt}}(t_1 - t_{\text{src}})}$$

▷ $t = t_2 - t_1 = a, 2a, \dots$ **Euclidean time**

▷ $t_2 - t_{\text{snk}}, t_{\text{src}} - t_1 \gg 0$ checked

Γ_{fg} from lattice QCD

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{q_0^{\max}} dq_0 (q_0^{\max} - q_0)^n Z_n$$

- Z_0, Z_1, Z_2 can be expressed as linear combinations of $H_{fg}^{\mu\nu}$
- allowed q^2 range depends on flavour combination fg
- σ : smearing parameter
- A: systematical error in HLT
- B: statistical error in HLT
- combined with λ

Γ_{fg} from lattice QCD

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \lim_{\sigma \rightarrow 0} \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{\infty} dq_0 (q_0^{\max} - q_0)^n \theta_{\sigma}(q_0^{\max} - q_0) Z_n$$

- Z_0, Z_1, Z_2 can be expressed as linear combinations of $H_{fg}^{\mu\nu}$
- allowed q^2 range depends on flavour combination fg
- σ : smearing parameter
- A: systematical error in HLT
- B: statistical error in HLT
- combined with λ

Configurations

name	L [fm]	a [fm]	M_π [MeV]
B48	3.82	0.080	≈ 135
B64	5.10	0.080	≈ 135
B96	7.64	0.080	≈ 135
C80	5.46	0.068	≈ 135
D96	5.46	0.057	≈ 135
E112	5.48	0.049	≈ 135

- ETMC-configurations
- $\mathcal{O}(a)$ and clover improved
- $N_f = 2 + 1 + 1$
- ten momenta per ensemble
- three decay channels
- two smearing kernels
- $\mathcal{O}(10)$ values of σ

Finite-Volume-Effects

Flat volume dependence, HLT result stable

Finite-Volume-Effects

Quantify systematic effects of finite volume:

$$P_L(\sigma, q^2) = \frac{x(\sigma, q^2, L) - x\left(\sigma, q^2, \frac{3L}{2}\right)}{\sqrt{\Delta_{\text{stat}}^2(\sigma, q^2, L) + \Delta_{\text{stat}}^2\left(\sigma, q^2, \frac{3L}{2}\right)}}$$

Calculate systematic error:

$$\Delta_{\text{sys}}(\sigma, q^2) = \left| x(L) - x\left(\frac{3L}{2}\right) \right| \cdot \text{erf}\left(\frac{P_L(\sigma, q^2)}{\sqrt{2}}\right)$$

Order 1: continuum limit; smearing limit

$$fg=cs, Z_0, \mathbf{q}^2=0.314 [\text{GeV}]^2, \sigma = 436 [\text{MeV}],$$

- AIC-combination of linear and constant fit
- flat limit
- small effect

Order 1: continuum limit; **smearing limit**

$$fg=cs, Z_0, \mathbf{q}^2 = 0.31 \text{ [GeV]}^2$$

- combination of two kernels
- good agreement between kernels
- smooth extrapolations for all contributions
- even powers of σ

Order 1: continuum limit; **smearing limit**

$$fg=cs, Z_1, \mathbf{q}^2 = 0.31 \text{ [GeV]}^2$$

- combination of two kernels
- good agreement between kernels
- smooth extrapolations for all contributions
- even powers of σ

Order 1: continuum limit; **smearing limit**

$$fg=cs, Z_2, \mathbf{q}^2 = 0.31 \text{ [GeV]}^2$$

- combination of two kernels
- good agreement between kernels
- smooth extrapolations for all contributions
- even powers of σ

Order 2: **smearing limit**; continuum limit

- B64, Z_0
- $q^2 = 0.31\text{GeV}^2$
- good agreement between kernels
- even powers of σ

Order 2: smearing limit; **continuum limit**

- $Z_0,$
 $q^2 = 0.31\text{GeV}^2$

Comparing order of limits

⇒ The two different orders are compatible

Calculation total decay rates

- B64, stat. error
- $Z_0 + Z_1 + Z_2$
- interpolation with cubic splines
- piecewise integration
- different momenta regions for different decay channels

Summary

Summary

Summary

- HLT method well suited
- systematics under control
- good agreement with experimental results

Summary

Outlook

- ✓ Quark Mass Dependence
- ✓ Contribution from $fg = su$

Thank you for your attention!

Definition of Z_n

$$Z_0 \equiv Y_2 + Y_3 - 2Y_4 \quad Z_1 \equiv 2(Y_3 - 2Y_1 - Y_4) \quad Z_2 \equiv Y_3 - 2Y_1$$

Form factors decomposition of the hadronic tensor

$$m_{D_s}^3 H^{\mu\nu}(p, p_X) = g^{\mu\nu} m_{D_s}^2 h_1 + p^\mu p^\nu h_2 + (p - p_X)^\mu (p - p_X)^\nu h_3 \\ + [p^\mu (p - p_X)^\nu + (p - p_X)^\mu p^\nu] h_4 - i \varepsilon^{\mu\nu\alpha\beta} p_\alpha (p - p_X)_\beta h_5$$

$$Y_1 = -m_{D_s} \sum_{ij} \hat{n}^i \hat{n}^j H^{ij} = h_1$$

$$Y_2 = m_{D_s} H^{00} = h_1 + h_2 + \left(1 - \frac{q_0}{m_{D_s}}\right)^2 h_3 + 2\left(1 - \frac{q_0}{m_{D_s}}\right) h_4$$

$$Y_3 = m_{D_s} \sum_{ij} \hat{q}^i \hat{q}^j H^{ij} = -h_1 m_{D_s}^2 + |\mathbf{q}|^2 h_3$$

$$Y_4 = -m_{D_s} \sum_i \hat{q}^i H^{0i} = \left(1 - \frac{q_0}{m_{D_s}}\right) |\mathbf{q}| h_3 + |\mathbf{q}| h_4$$

$$Y_5 = \frac{i m_{D_s}}{2} \sum_{ijk} \varepsilon^{ijk} \hat{q}^k H^{ij} = |\mathbf{q}| h_5$$

$$\hat{n}^2 = 1$$

$$\hat{n} \cdot \mathbf{q} = 0$$

$$\hat{\mathbf{q}} = \mathbf{q}/|\mathbf{q}|$$

Motivations

Exploratory study of the $H \mapsto X\ell\nu$ decay done in P. Gambino et al. (2022), but

- ▶ Unphysical ensemble
- ▶ $L \mapsto \infty$ and $a \mapsto 0$ limits missing
- ▶ Comparison only with OPE

Motivations

The **experimental precision** of $D_s \mapsto X\ell\nu$ data, achievable from the lattice, offers the opportunity to do a **complete phenomenologically relevant calculation** and at the same time to **validate the method**

Exploratory study of the $H \mapsto X\ell\nu$ decay done in P. Gambino et al. (2022), but

- ▷ Unphysical ensemble
- ▷ $L \mapsto \infty$ and $a \mapsto 0$ limits missing
- ▷ Comparison only with OPE

$$\Gamma_{\text{semi-lep.}} = 8.27(21) \times 10^{-14} \text{ GeV (2.5\%)} \text{ BES-III}$$

Theoretical background

Inclusive semi-leptonic $D_s \mapsto X \ell \nu$ decay

[P. Gambino and S. Hashimoto (2020), S. Hashimoto (2017)]

- ▷ Incoming D_s meson at rest, $p^2 = m_{D_s}^2$
- ▷ Outgoing X hadron, $p_X = (q_0, \mathbf{q})$
- ▷ $\hat{j}_{gf}^\mu(x) = i\bar{g}(x)\gamma^\mu(1 - \gamma_5)f(x)$

$$\Gamma = G_F^2 \left(|V_{cd}|^2 \Gamma_{cd} + |V_{cs}|^2 \Gamma_{cs} + |V_{us}|^2 \Gamma_{su} \right)$$

Each contribution is given by

$$\Gamma_{fg} = \int \frac{d^3 p_\nu}{(2\pi)^3 2E_\nu} \frac{d^3 p_\ell}{(2\pi)^3 2E_\ell} L_{\mu\nu}(p_\ell, p_\nu) \mathbf{H}_{fg}^{\mu\nu}(\mathbf{p}, \mathbf{p}_X)$$

with $L_{\mu\nu}$ standard leptonic tensor and the **fully non-perturbative hadronic tensor**

$$\mathbf{H}_{fg}^{\mu\nu}(\mathbf{p}, \mathbf{p}_X) = \frac{(2\pi)^4}{2m_{D_s}} \langle D_s | \hat{J}_{fg}^\mu(0) \delta^4(\mathbb{P} - p_X) \hat{J}_{fg}^{\nu\dagger}(0) | D_s \rangle$$

After a lengthy (but straightforward) derivation ...

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{q_0^{\max}} dq_0 (q_0^{\max} - q_0)^n Z_n,$$

$Z_n = \text{linear combinations of } H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2)$

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{q_0^{\max}} dq_0 (q_0^{\max} - q_0)^n Z_n, \quad \boxed{Z_n = \text{linear combinations of } H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2)}$$

To treat numerically the integral we introduce a regularized version of the θ -function

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \lim_{\sigma \rightarrow 0} \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{\infty} dq_0 (q_0^{\max} - q_0)^n \theta_{\sigma}(q_0^{\max} - q_0) Z_n$$

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{q_0^{\max}} dq_0 (q_0^{\max} - q_0)^n Z_n,$$

$$Z_n = \text{linear combinations of } H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2)$$

To treat numerically the integral we introduce a regularized version of the θ -function

$$24\pi^3 \frac{d\Gamma_{fg}}{d\mathbf{q}^2} = \lim_{\sigma \rightarrow 0} \sum_{n=0}^2 |\mathbf{q}|^{3-n} \int_{q_0^{\min}}^{\infty} dq_0 (q_0^{\max} - q_0)^n \theta_{\sigma}(q_0^{\max} - q_0) Z_n$$

$$\lim_{\sigma \rightarrow 0} \theta_{\sigma}(x) = \theta(x)$$

$$\theta_{\sigma}^{\text{SIG}}(x) = \frac{1}{1 + e^{-x/\sigma}}$$

$$\theta_{\sigma}^{\text{ERF}}(x) = \frac{1 + \text{erf}(x/\sigma)}{2}$$

The final hadron phase-space

$$q_0 \in \left[\sqrt{m_{fg}^2 + \mathbf{q}^2}, m_{D_s} - |\mathbf{q}| \right] \quad m_{fg}^2 \text{ lightest mass in the spectrum}$$

The final hadron phase-space

$$q_0 \in \left[\sqrt{m_{fg}^2 + \mathbf{q}^2}, m_{D_s} - |\mathbf{q}| \right] \quad m_{fg}^2 \text{ lightest mass in the spectrum}$$

Asymptotic expansion for small σ : fit Ansatz for $\sigma \mapsto 0$ extrapolation

[A. Evangelista et. al (2023)]

$$\Delta\rho_\sigma = \int_0^\infty dq_0 x^n [\theta_\sigma(x) - \theta(x)] \rho(q_0)$$

$x = q_0^{\max} - q_0$

▷ If $\rho(q_0)$ is **regular** at q_0^{\max}

Asymptotic expansion for small σ : fit Ansatz for $\sigma \mapsto 0$ extrapolation

[A. Evangelista et. al (2023)]

$$\Delta\rho_\sigma = \int_0^\infty dq_0 x^n [\theta_\sigma(x) - \theta(x)] \rho(q_0)$$

$x = q_0^{\max} - q_0$

▷ If $\rho(q_0)$ is **regular** at q_0^{\max}

▷ $n = 0, 1$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^2)$ + even powers $(Z_{0,1})$

▷ $n = 2$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^4)$ + even powers (Z_2)

Asymptotic expansion for small σ : fit Ansatz for $\sigma \mapsto 0$ extrapolation

[A. Evangelista et. al (2023)]

$$\Delta\rho_\sigma = \int_0^\infty dq_0 x^n [\theta_\sigma(x) - \theta(x)] \rho(q_0)$$

$x = q_0^{\max} - q_0$

- ▷ If $\rho(q_0)$ is **regular** at q_0^{\max}
 - ▷ $n = 0, 1$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^2)$ + even powers ($Z_{0,1}$)
 - ▷ $n = 2$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^4)$ + even powers (Z_2)

- ▷ If $\rho(q_0) = Z \cdot \delta(q_0 - q_0^{\max}) + \dots$
 - ▷ $n = 0$ $\Delta\rho_\sigma = \frac{1}{2}Z$!?
 - ▷ $n > 0$ $\Delta\rho_\sigma = 0$

Asymptotic expansion for small σ : fit Ansatz for $\sigma \mapsto 0$ extrapolation

[A. Evangelista et. al (2023)]

$$\Delta\rho_\sigma = \int_0^\infty dq_0 x^n [\theta_\sigma(x) - \theta(x)] \rho(q_0)$$

$$x = q_0^{\max} - q_0$$

▷ If $\rho(q_0)$ is **regular** at q_0^{\max}

▷ $n = 0, 1$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^2)$ + even powers ($Z_{0,1}$)

▷ $n = 2$ $\Delta\rho_\sigma = \mathcal{O}(\sigma^4)$ + even powers (Z_2)

▷ If $\rho(q_0) = Z \cdot \delta(q_0 - q_0^{\max}) + \dots$

▷ $n = 0$ $\Delta\rho_\sigma = \frac{1}{2}Z$!?

▷ $n > 0$ $\Delta\rho_\sigma = 0$

! Decay rate is not vanishing at q_{\max}^2

? Experimental prescription may differ

Γ_{fg} from lattice QCD

We need the hadronic tensor which is the **spectral density** of the correlation function

$$M_{fg}^{\mu\nu}(t, \mathbf{q}^2) = \int_0^\infty dq_0 H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2) e^{-q_0 t}$$

Γ_{fg} from lattice QCD

We need the hadronic tensor which is the **spectral density** of the correlation function

$$M_{fg}^{\mu\nu}(t, \mathbf{q}^2) = \int_0^\infty dq_0 H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2) e^{-q_0 t}$$

that in practice is obtained by

$$M_{fg}^{\mu\nu}(t_2 - t_1, \mathbf{q}^2) = \lim_{\substack{t_{\text{snk}} \rightarrow +\infty \\ t_{\text{src}} \rightarrow -\infty}} \frac{C_{4\text{pt}}^{\mu\nu}(t_{\text{snk}}, t_2, t_1, t_{\text{src}}; \mathbf{q})}{C_{2\text{pt}}(t_{\text{snk}} - t_2) C_{2\text{pt}}(t_1 - t_{\text{src}})}$$

▷ $t = t_2 - t_1 = a, 2a, \dots$ **Euclidean time**

▷ $t_2 - t_{\text{snk}}, t_{\text{src}} - t_1 \gg 0$ checked

Going from

$$M_{fg}^{\mu\nu}(t, \mathbf{q}) = \int_0^\infty dq_0 H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2) e^{-q_0 t}$$

to

$$\int_{q_0^{\min}}^\infty dq_0 (q_0^{\max} - q_0)^n \theta_\sigma(q_0^{\max} - q_0) H_{fg}^{\mu\nu}(q_0, \mathbf{q}^2)$$

implies solving a **numerically ill-conditioned** (but mathematically well-posed) **inverse Laplace transform**

- ▷ $t = a, 2a, 3a, \dots < \infty$, scarce information
- ▷ signal-to-noise ratio of $M_{fg}^{\mu\nu}(t, \mathbf{q})$ deteriorates exponentially

In general we want to extract $\rho_\sigma = \int d\omega K_\sigma(\omega)\rho(\omega)$ from $C(t) = \int_0^\infty d\omega e^{-\omega t}\rho(\omega)$

- ▶ A **linear estimator** for the solution can be written by **approximating the target smearing (Schwartz) kernel**

$$\rho_\sigma = \sum_{\tau=1}^T g_\tau C(a\tau)$$

$$K_{\sigma,T}^{\text{approx}} = \sum_{\tau=1}^T g_\tau(T) e^{-a\omega\tau}$$

- ▶ The estimator is **model independent and unbiased** in the limits $T \mapsto \infty$ and vanishing statistical errors

$$\lim_{T \mapsto \infty} K_{\sigma,T}^{\text{approx}} = K_\sigma$$

In general we want to extract $\rho_\sigma = \int d\omega K_\sigma(\omega)\rho(\omega)$ from $C(t) = \int_0^\infty d\omega e^{-\omega t}\rho(\omega)$

- ▶ A **linear estimator** for the solution can be written by **approximating the target smearing (Schwartz) kernel**

$$\rho_\sigma = \sum_{\tau=1}^T g_\tau C(a\tau)$$

$$K_{\sigma,T}^{\text{approx}} = \sum_{\tau=1}^T g_\tau(T) e^{-a\omega\tau}$$

- ▶ The estimator is **model independent and unbiased** in the limits $T \mapsto \infty$ and vanishing statistical errors

$$\lim_{T \mapsto \infty} K_{\sigma,T}^{\text{approx}} = K_\sigma$$

For $T < \infty$ one needs to estimate the residual **systematic** uncertainty due to the kernel approximation in addition to **statistical** error

- ▶ The coefficients \mathbf{g} are calculated by minimizing

$$W[\lambda, \mathbf{g}] = (1 - \lambda) \frac{A[\mathbf{g}]}{A[\mathbf{0}]} + \lambda B[\mathbf{g}]$$

- ▶ Suppression of the **statistical error**

$$B[\mathbf{g}] = \mathbf{g}^T \cdot \text{C}\hat{\text{O}}\text{V}[C(t)] \cdot \mathbf{g} \equiv (\delta\rho)^2$$

- ▶ **Accuracy of the approximated** kernel

$$A[\mathbf{g}] = \int_{E_0}^{\infty} d\omega \left\{ \sum_{\tau=1}^T g_{\tau} e^{-a\omega\tau} - K_{\sigma}^{\text{target}} \right\}^2 \quad E_0 \sim 0.9 \cdot q_0^{\min}$$

Stability analysis to tune λ

$$\rho_{\star} : \quad \frac{A[g]}{A[0]B[g]} = 10^3 \quad \text{plateaux}$$

$$\rho_{\star\star} : \quad \frac{A[g]}{A[0]B[g]} = 10^2 \quad \text{systematic}$$

pull variable to assess systematic over stactical error

$$P^{\text{HLT}} = \frac{\rho_{\star} - \rho_{\star\star}}{\sqrt{\delta\rho_{\star}^2 + \delta\rho_{\star\star}^2}}$$

$$\Delta^{\text{sys}} = |\rho_{\star} - \rho_{\star\star}| \operatorname{erf} \left(\frac{P^{\text{HLT}}}{\sqrt{2}} \right)$$

★(Z_1 and Z_2 in backup)

$\mathcal{O}(3000)$ stability analysis in one plot

Distribution of the pull variable P^{HLT} across all the stability analysis

C80 requires more statistics

Results ad fixed ensemble and σ

Results ad fixed ensemble and σ

Γ_{cd} is Cabibbo suppressed

Conclusions

- ▶ The HLT method offers a solid way-out to the challenging computation of inclusive decay rates, but that is not enough to do physics ...

Conclusions

- ▷ The HLT method offers a solid way-out to the challenging computation of inclusive decay rates, but that is not enough to do physics ...

Next-to-do list

Definition of Z_n

$$\boxed{Z_0 \equiv Y_2 + Y_3 - 2Y_4 \quad Z_1 \equiv 2(Y_3 - 2Y_1 - Y_4) \quad Z_2 \equiv Y_3 - 2Y_1}$$

Form factors decomposition of the hadronic tensor

$$m_{D_s}^3 H^{\mu\nu}(p, p_x) = g^{\mu\nu} m_{D_s}^2 h_1 + p^\mu p^\nu h_2 + (p - p_x)^\mu (p - p_x)^\nu h_3 \\ + [p^\mu (p - p_x)^\nu + (p - p_x)^\mu p^\nu] h_4 - i \varepsilon^{\mu\nu\alpha\beta} p_\alpha (p - p_x)_\beta h_5$$

$$Y_1 = -m_{D_s} \sum_{ij} \hat{n}^i \hat{n}^j H^{ij} = h_1$$

$$Y_2 = m_{D_s} H^{00} = h_1 + h_2 + \left(1 - \frac{q_0}{m_{D_s}}\right)^2 h_3 + 2 \left(1 - \frac{q_0}{m_{D_s}}\right) h_4$$

$$Y_3 = m_{D_s} \sum_{ij} \hat{q}^i \hat{q}^j H^{ij} = -h_1 m_{D_s}^2 + |\mathbf{q}|^2 h_3$$

$$Y_4 = -m_{D_s} \sum_i \hat{q}^i H^{0i} = \left(1 - \frac{q_0}{m_{D_s}}\right) |\mathbf{q}| h_3 + |\mathbf{q}| h_4$$

$$Y_5 = \frac{i m_{D_s}}{2} \sum_{ijk} \varepsilon^{ijk} \hat{q}^k H^{ij} = |\mathbf{q}| h_5$$

$$\hat{n}^2 = 1$$

$$\hat{n} \cdot \mathbf{q} = 0$$

$$\hat{\mathbf{q}} = \mathbf{q}/|\mathbf{q}|$$

Production line

This is repeated for:

- ▷ 2 channels, third coming
- ▷ Z_0 , Z_1 and Z_2
- ▷ 2 smearing kernels
- ▷ $\mathcal{O}(10)$ vales of σ
- ▷ 10 values of \mathbf{q}^2
- ▷ for each ensemble

ETMC ensembles all close to physical point

ID	$L^3 \times T$	a [fm]	L [fm]
B48	$48^3 \times 96$	0.07951	3.82
B64	$64^3 \times 128$	0.07951	5.09
B96	$96^3 \times 192$	0.07951	7.63
C80	$80^3 \times 160$	0.06816	5.45

E112	$112^3 \times 224$	0.04891	5.47

Final results

Spline interpolation + trapezoid integration

$\sigma \mapsto 0$ extrapolation

- ▷ Z_0 : σ^2 + even powers
- ▷ Z_1 : σ^2 + even powers
- ▷ Z_2 : σ^4 + even powers

Continuum extrapolation

$fg=cs, Z_0, q^2=0.035 [\text{GeV}]^2, \sigma = 436 [\text{MeV}]$,

$fg=cs, Z_1, q^2=0.314 [\text{GeV}]^2, \sigma = 436 [\text{MeV}]$,

Pull of significance between finest lattice spacing and extrapolated point

Lepton moments

Everything presented in this talk applies straightforwardly to the Lepton moments

$$m_{D_s}^{1+n} \frac{dM_{fg}^n}{d\mathbf{q}^2} = \int dq_0 \int dE_\ell E_\ell^n \frac{d\Gamma_{fg}}{dq_0 d\mathbf{q}^2 dE_\ell}$$

The first lepton moment reads

$$96\pi^4 m_{D_s} \frac{dM_{fg}^{(1)}}{d\mathbf{q}^2} = \lim_{\sigma \rightarrow 0} \sum_{n=0}^3 \mathbf{q}^{4-n} \int_0^\infty dq_0 (q_0^{\max} - q_0)^n \theta_\sigma(q_0^{\max} - q_0) Z_n^{(1)}$$

with

$$Z_0^{(1)} = Y_2 + Y_3 - 2Y_4$$

$$Z_1^{(1)} = -4Y_1 + Y_2 + 3Y_3 - 4Y_4 + 2Y_5$$

$$Z_2^{(1)} = -6Y_1 + 3Y_3 - 2Y_4 + Y_5$$

$$Z_3^{(1)} = -2Y_1 + Y_3$$

Exclusive ground-state contribution to Γ_{fg}

$$\frac{d\Gamma_{fg}^{\text{ex}}}{d\mathbf{q}^2} = \frac{1}{24\pi^3} \frac{m_{D_s}}{q_0} |\mathbf{q}|^3 f_+^2(\mathbf{q}^2)$$

$f_+^2(\mathbf{q}^2)$ can be computed by fitting the leading exponential contribution to the correlation functions
