Spectral analysis for nucleon-pion and nucleon-pion-pion states in both parity sectors using distillation with domain wall fermions

Friday, 2 August 2024 12:15 (20 minutes)

We present a study using the distillation method to analyze the spectra of nucleon, nucleon-pion, and nucleon-pion-pion states in the positive parity sector as well as nucleon and nucleon-pion states in the negative sector. The study involves using five domain wall fermion ensembles with varying pion masses ($m_\pi = 139\text{--}279$ MeV), lattice spacings ($a^{-1} = 1.730$ GeV and $a^{-1} = 2.359$ GeV) and volumes ($m_\pi L = 3.84\text{--}7.59$). To tackle the large number of contractions in this project, we implemented an algorithm to automate the contraction of general nucleon pion correlation functions containing an arbitrary number of pions.
