ALICE masterclass : strange particles

Today's periodic system of the fundamental building blocks

What are strange particles ?

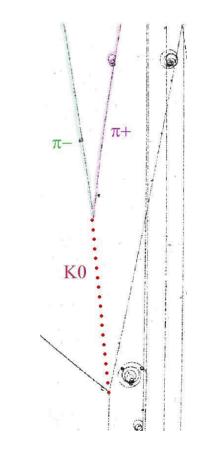

hadrons (baryons or mesons) containing at least one strange (s) quark

We will be looking for neutral strange particles, which travel some distance (mm or cm) from the point of production (collision point) before they decay into two oppositely charged particles

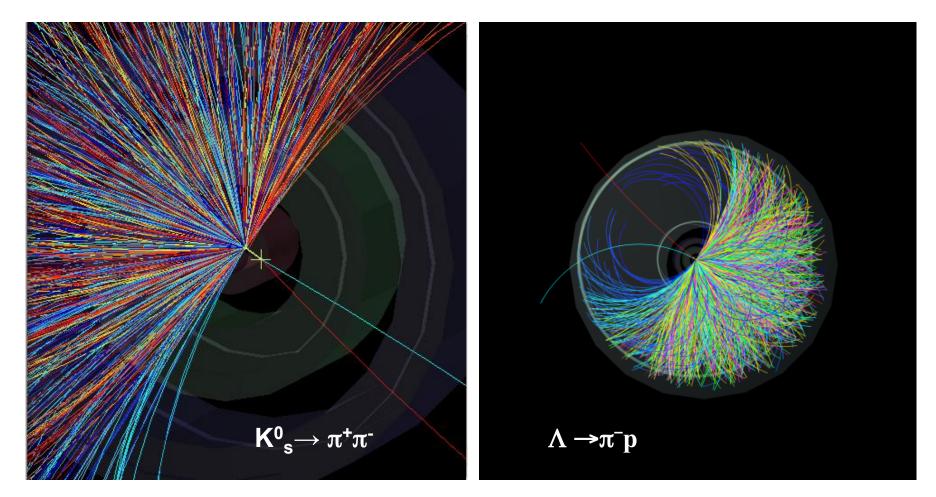

$$K_{s}^{0}$$
 → π⁺π⁻ τ = 0.89 x10⁻¹⁰ s
c τ = 3x10¹⁰ cm s⁻¹ x8.9x10⁻¹¹ s
2.67 cm from the point of interaction

$$\begin{array}{ll} \Lambda \rightarrow \pi^{-}p & \tau = 2.6 \, x 10^{-10} \, s \\ \hline & & & \\ - & & & \\ \Lambda \rightarrow \pi^{+}p & & 7.2 \, \text{cm distance from the point of interaction} \end{array}$$

Weak decays : strangeness is not conserved

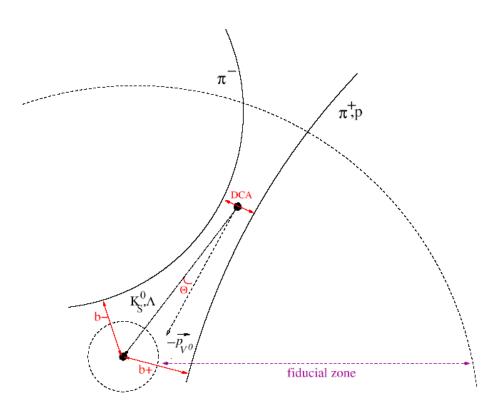

How do we find V0s ?

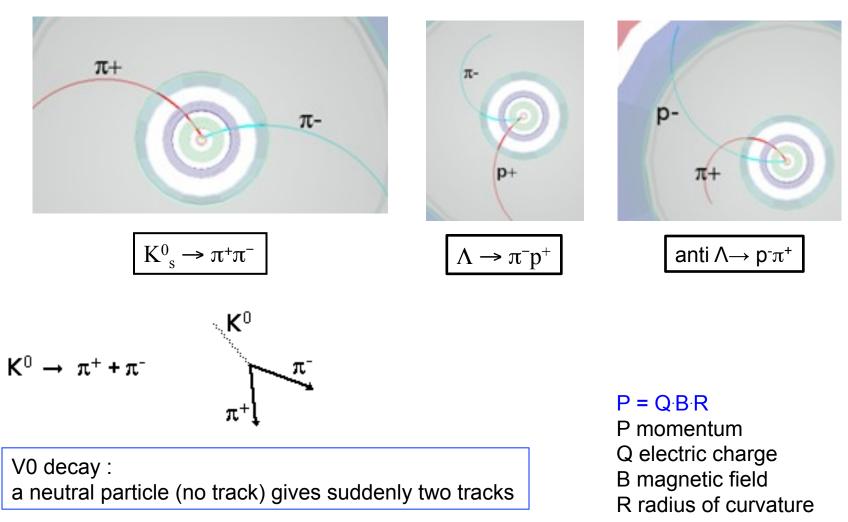

We look for two opposite tracks, having the same origin, which is not the interaction (collision) point

How do we find V0s ?

We look for two opposite tracks, having the same origin, which is not the interaction (collision) point

How do we identify each V0?

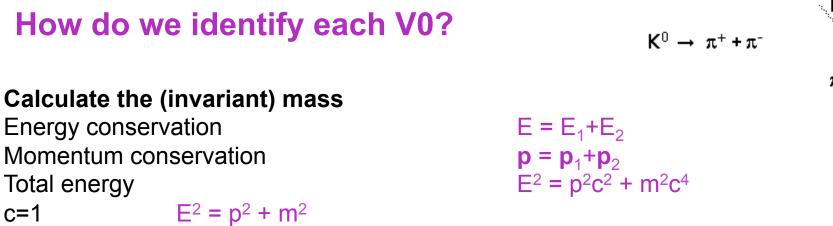

Identify V0s from the decay topology

30.07.2024

ALICE masterclass : strange particles

How do we identify each V0?

 $E = E_1 + E_2$ $E_1^2 = p_1^2 + m_1^2$ $E_2^2 = p_2^2 + m_2^2$

 $E^{2} = p^{2} + m^{2}$ $m^{2} = E^{2} - p^{2} = (E_{1} + E_{2})^{2} - (p_{1} + p_{2})^{2} = m_{1}^{2} + m_{2}^{2} + 2E_{1}E_{2} - 2p_{1} \cdot p_{2}$

Calculate the mass of the initial particle from the values of the mass and the momentum of the final particles

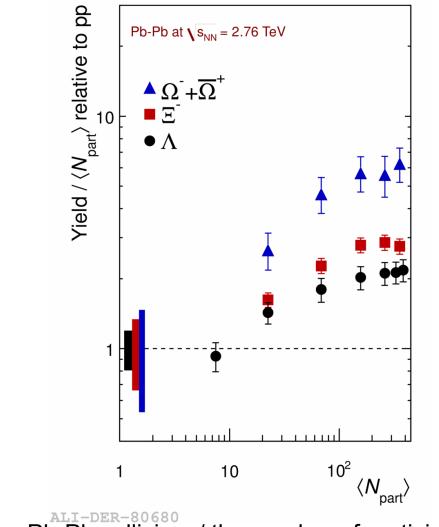

Particle Identification (done by a number of PID detectors) $\implies m_1 m_2$ Radius of curvature of the particle tracks due to magnetic field $\implies p_1 p_2$

P=Q B R (P momentum, Q electric charge, R radius of curvature, B magnetic field)

1^{st} part Identification of V0s (K_s, Λ , anti- Λ) in pp collisions

- Visual analysis of small samples (~15 events) of pp
- Find V0s with "V0 finder"
- Calculate invariant mass (with "calculator")
- Classify in corresponding histograms
- Merge all results at the end of the 1st part
- Comment on width of the peak, background events

Strangeness enhancement : one of the first signals of QGP

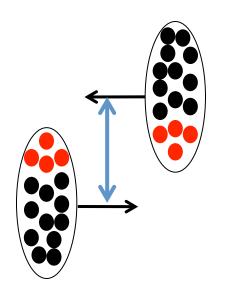

Enhancement increases with number of strange quarks in the hadron (Ω has 3, Ξ has 2, Λ has 1)

Particle yield for Pb-Pb collisions/ the number of participants

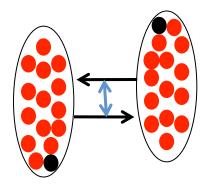

Particle yield for proton-proton collisions / 2

Geometry of a Pb-Pb collision

Peripheral collision

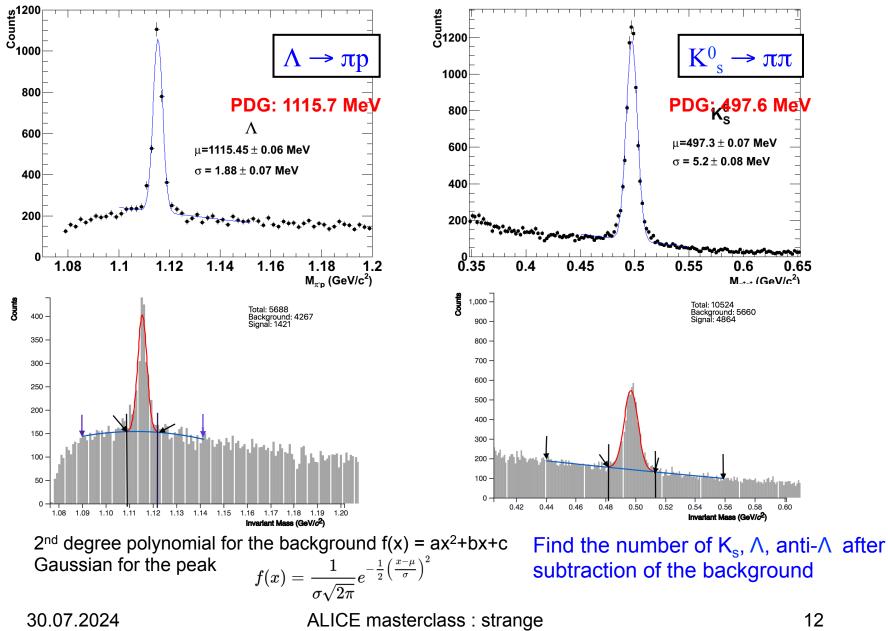

- Large distance between the centres of the nuclei
- Small number of participants
- Few charged particles produced (low multiplicity)

- Central collision
 - Small distance between the centres of the nuclei
 - Large number of participants
 - Many charged particles produced (high multiplicity)

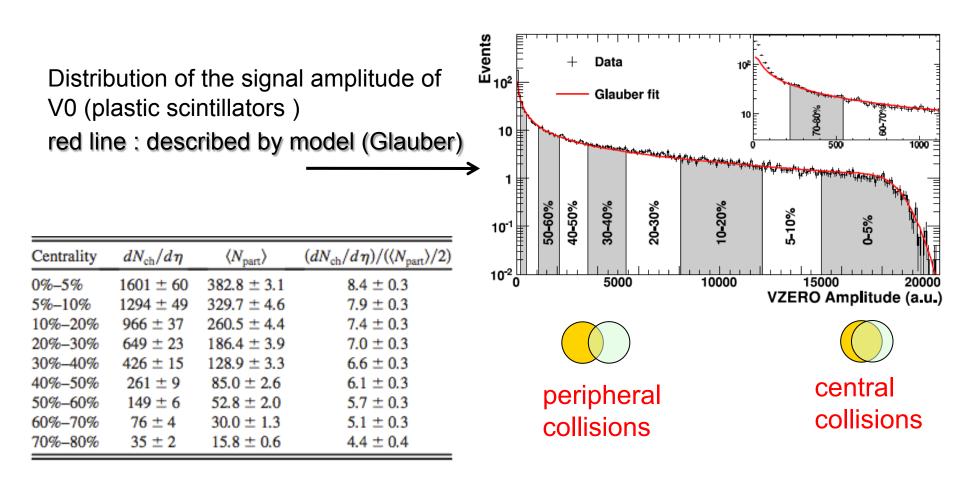

ALICE masterclass : strange particles

Fit functions describing the invariant mass distributions

particles

Centrality of Pb-Pb collisions

30.07.2024

ALICE masterclass : strange particles

Strangeness enhancement calculation

Yield : number of particles produced per interaction = Nparticles(produced)/Nevents

Efficiency = Nparticles(measured)/Nparticles(produced)*

Yield = Nparticles(measured)/(efficiency x Nevents)

 K_s -Yield (pp) = 0.25 /interaction ; Λ -Yield(pp) = 0.0617 /interaction ; $\langle N_{part} \rangle$ = 2 for pp

Strangeness enhancement: the particle yield normalised by the number of participating nucleons in the collision, and divided by the yield in proton-proton collisions**

*assumption on efficiency values : to match yields in Analysis Note Measurement of Ks and Λ spectra and yields in Pb–Pb collisions at $\sqrt{sNN=2.76}$ TeV with the ALICE experiment

*pp yields at 2.76 TeV from interpolation between 900 GeV and 7 TeV Analysis Note "Ks, Λ and anti Λ production in pp collisions at 7 TeV"

2nd part

Strangeness enhancement in lead-lead collisions

- Analysis of "large" event samples from lead collisions
- Find number of K_s , Λ , anti- Λ in different centrality regions
- Students' job: do appropriate fits to signal and background
- Results are sent to a server; for each case the average of all values corresponding to each case is taken into account
- Particle yields are calculated
- Strangeness enhancement is calculated taking into account particle yields in proton collisions
