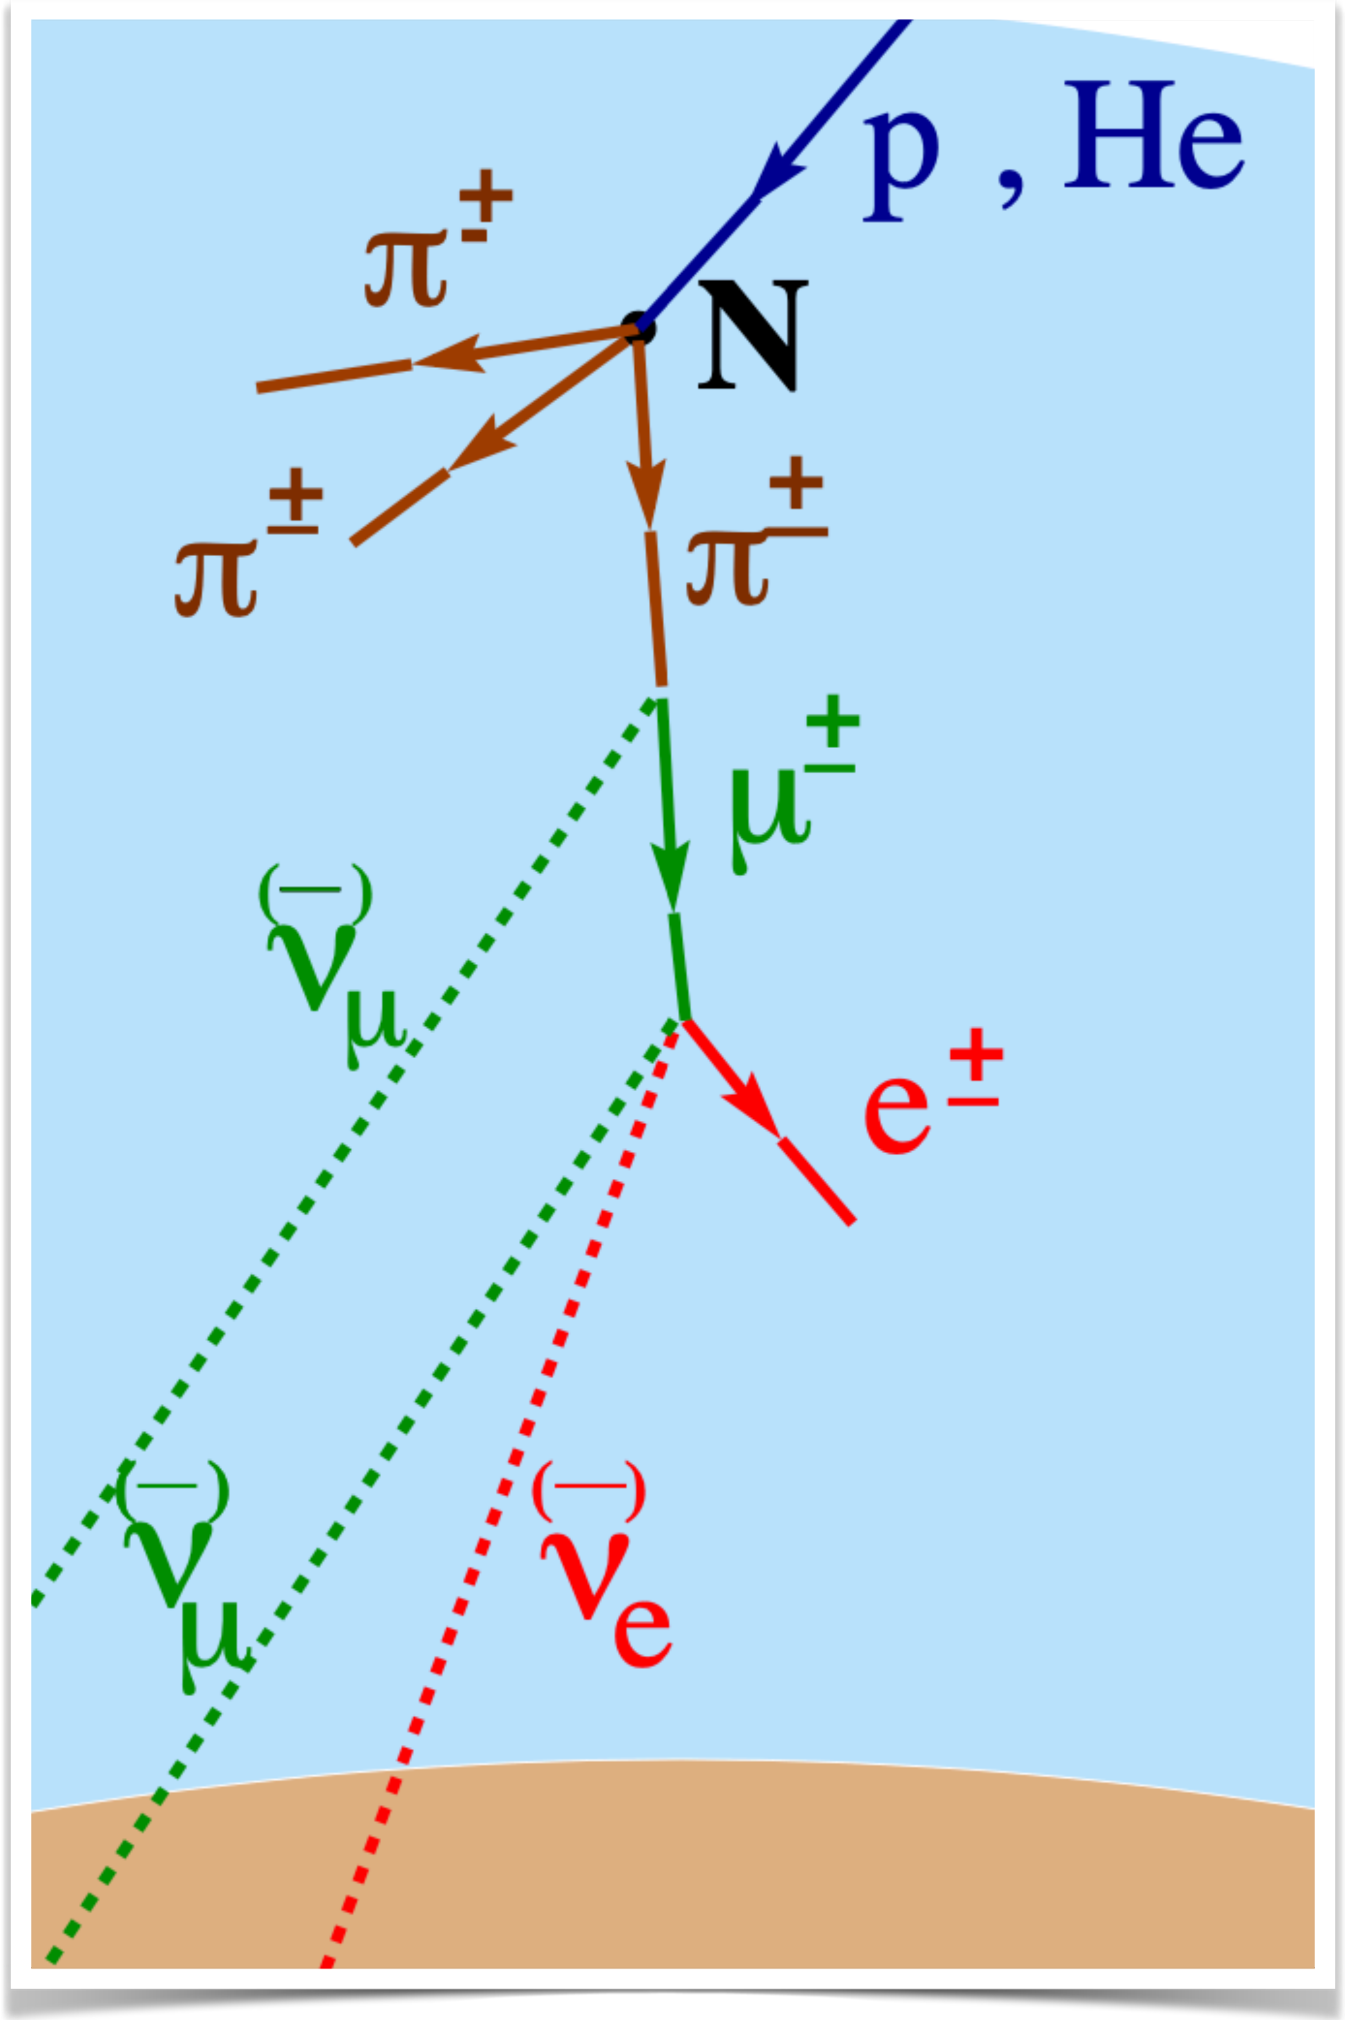
Neutrino Physics

Neutrino Oscillations in vacuum

Jessica Turner

Atmospheric neutrinos

- Neutrinos produced via cosmic rays (accelerated protons, He) in the atmosphere



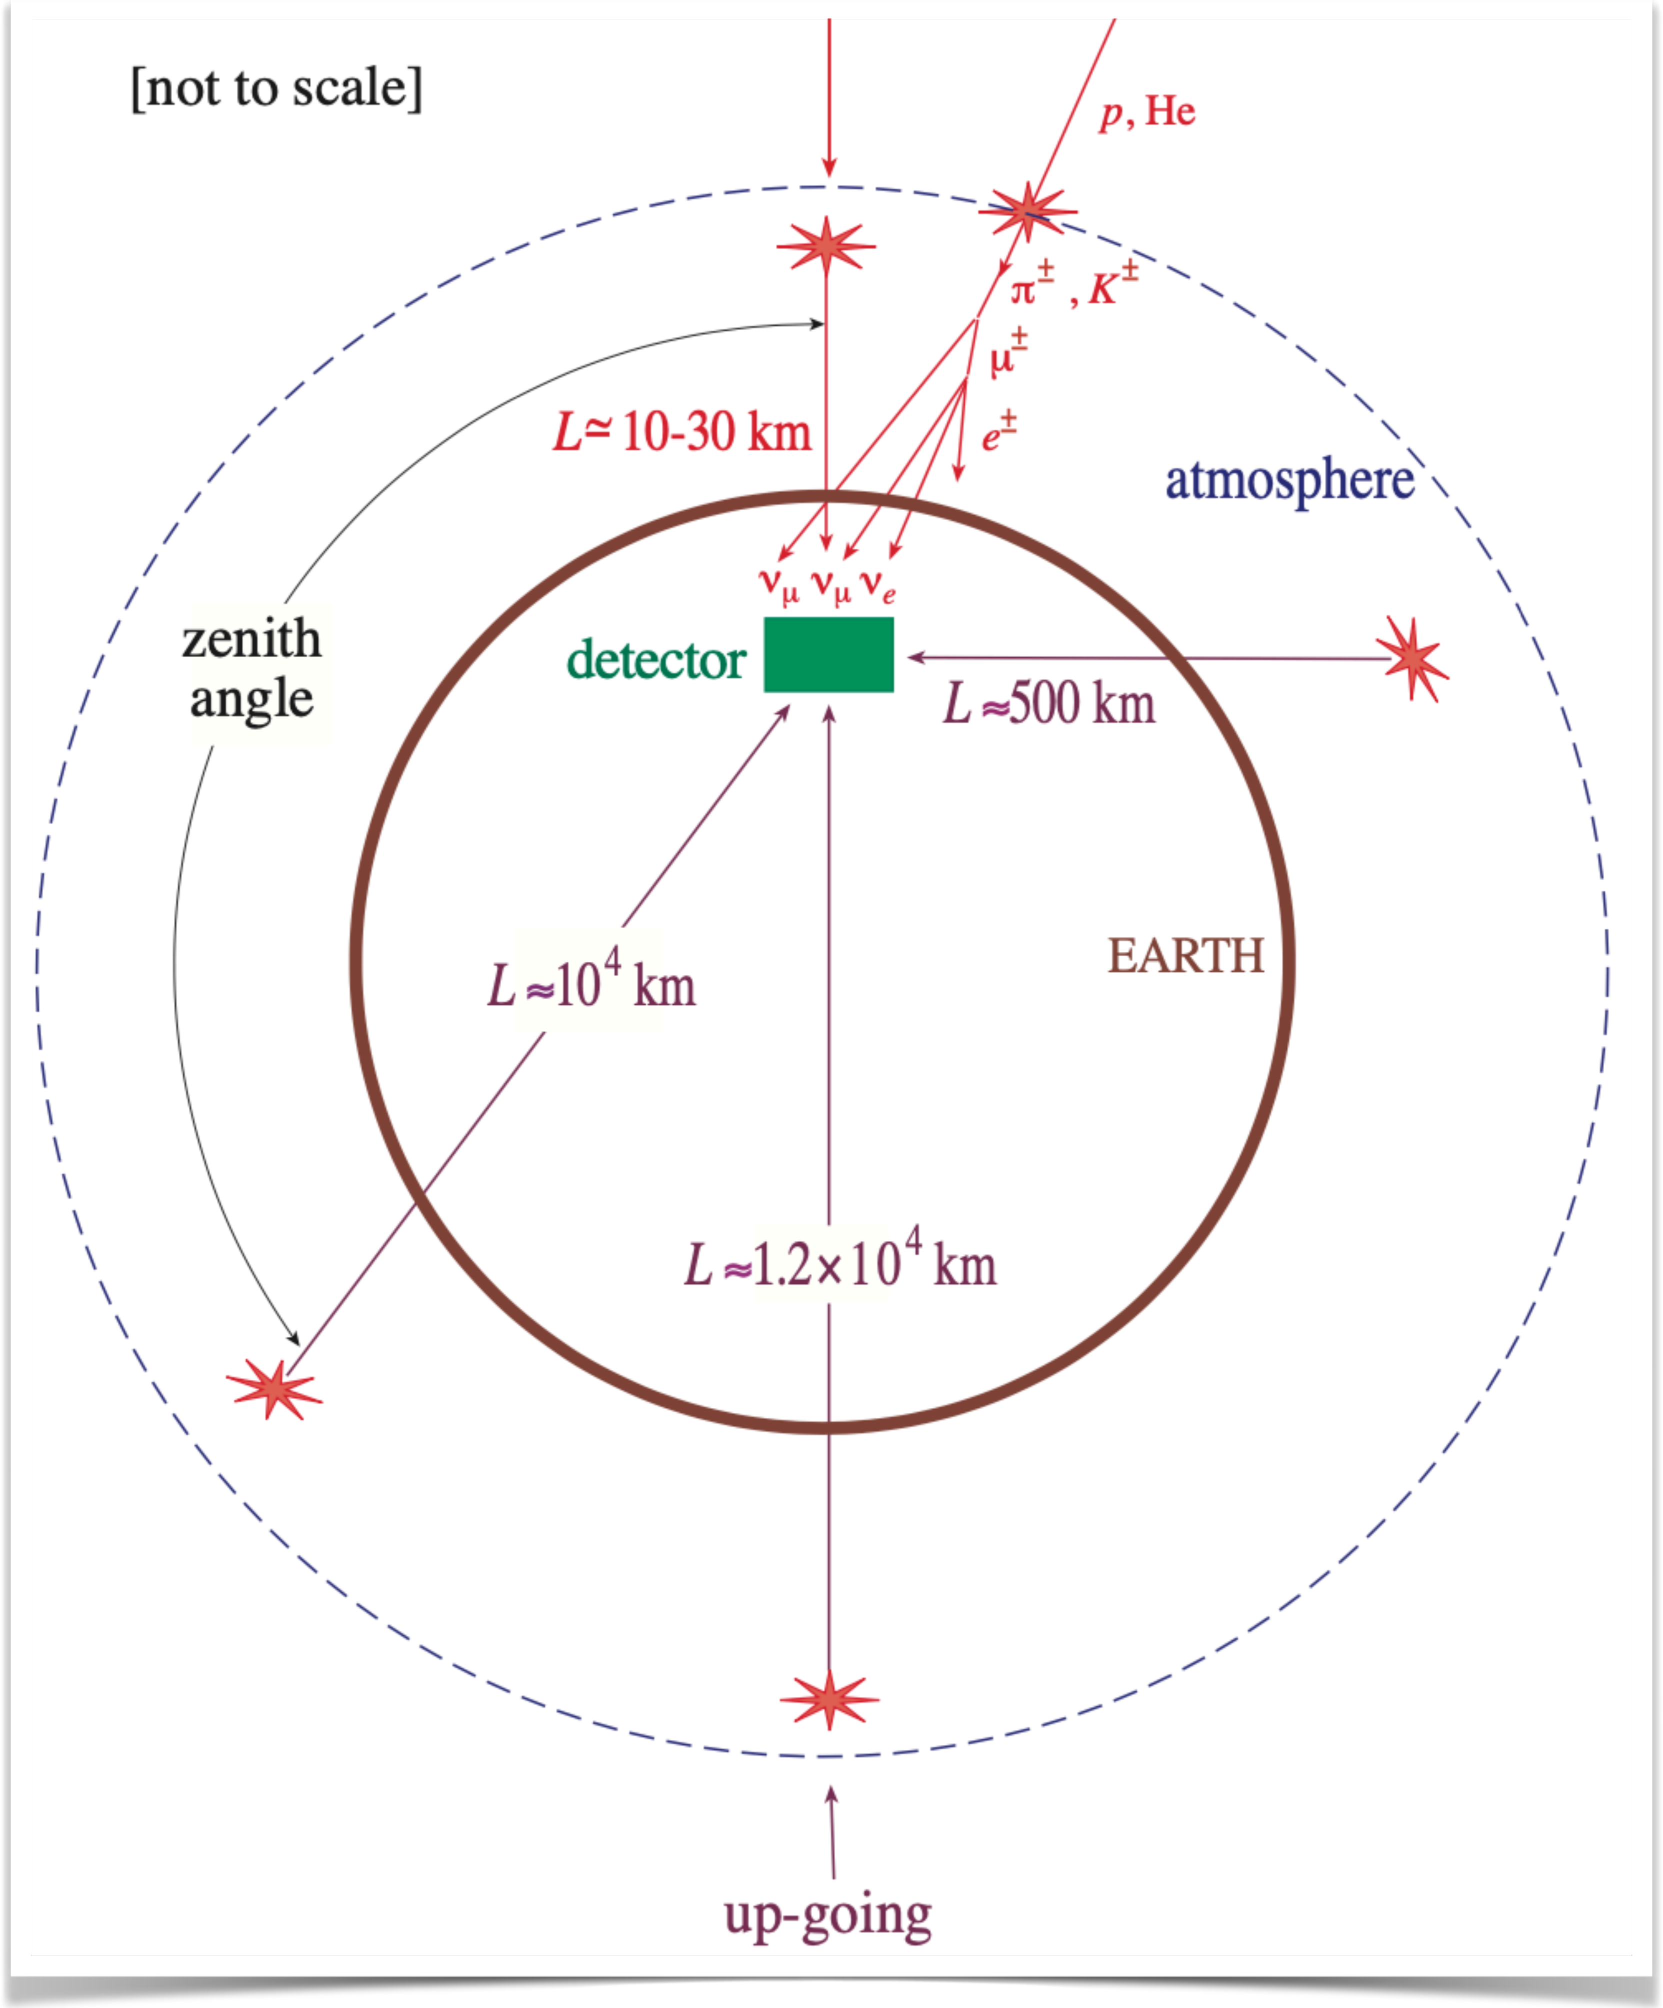
$$R_{\frac{\mu}{e}} \approx \frac{N_{\nu_\mu} + N_{\overline{\nu_\mu}}}{N_{\nu_e} + N_{\overline{\nu_e}}} \sim 2$$

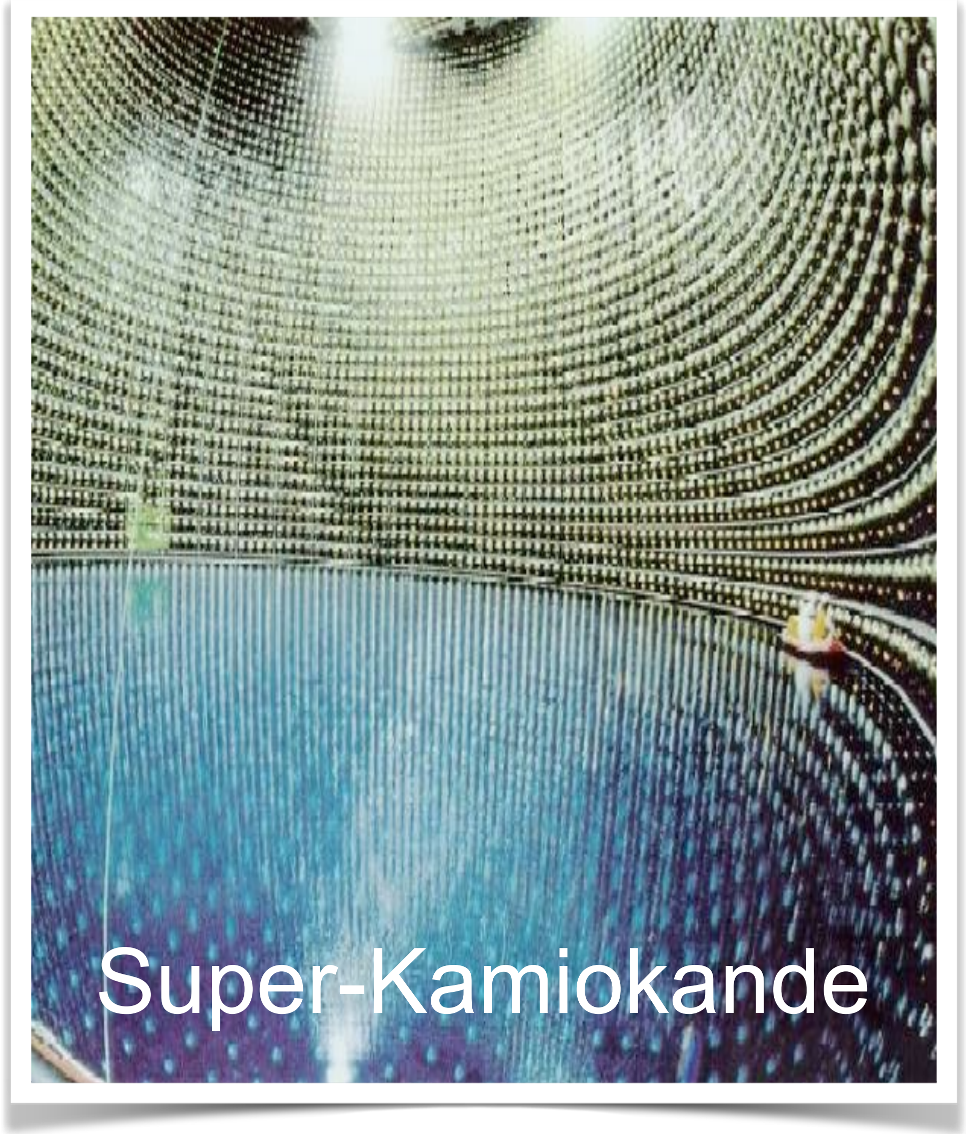
Exercise: show that

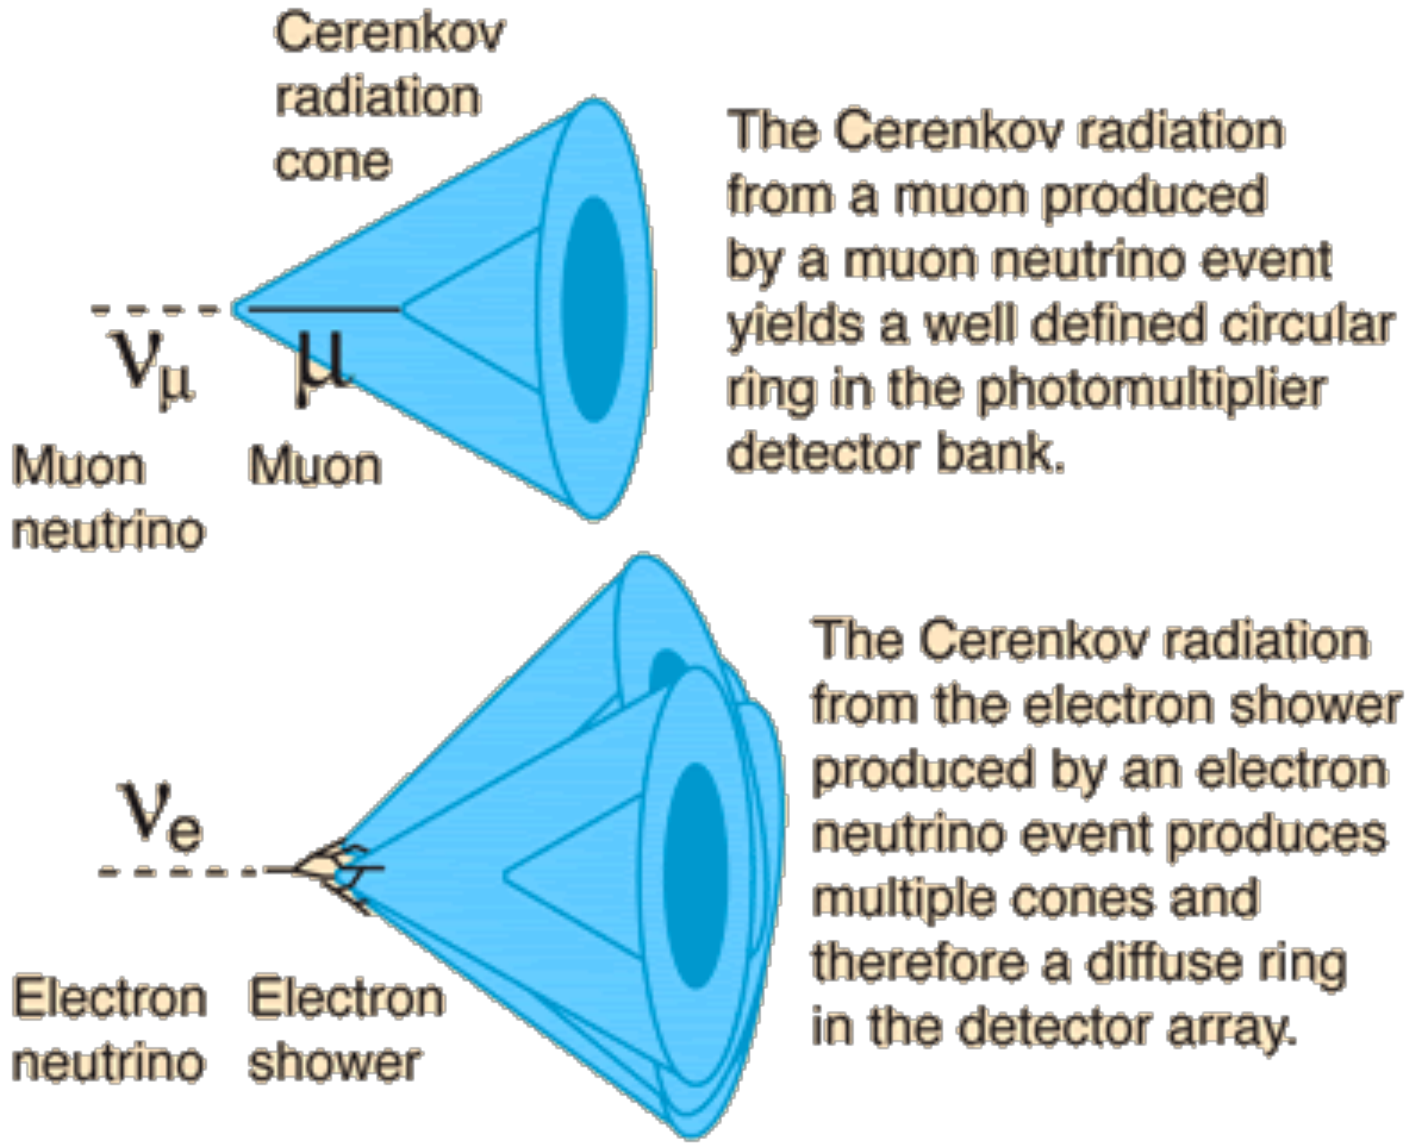
$$\frac{\Gamma\left(\pi^+ \to e^+ \nu_e\right)}{\Gamma\left(\pi^+ \to \mu^+ \nu_\mu\right)} \approx 2 \times 10^{-4}$$

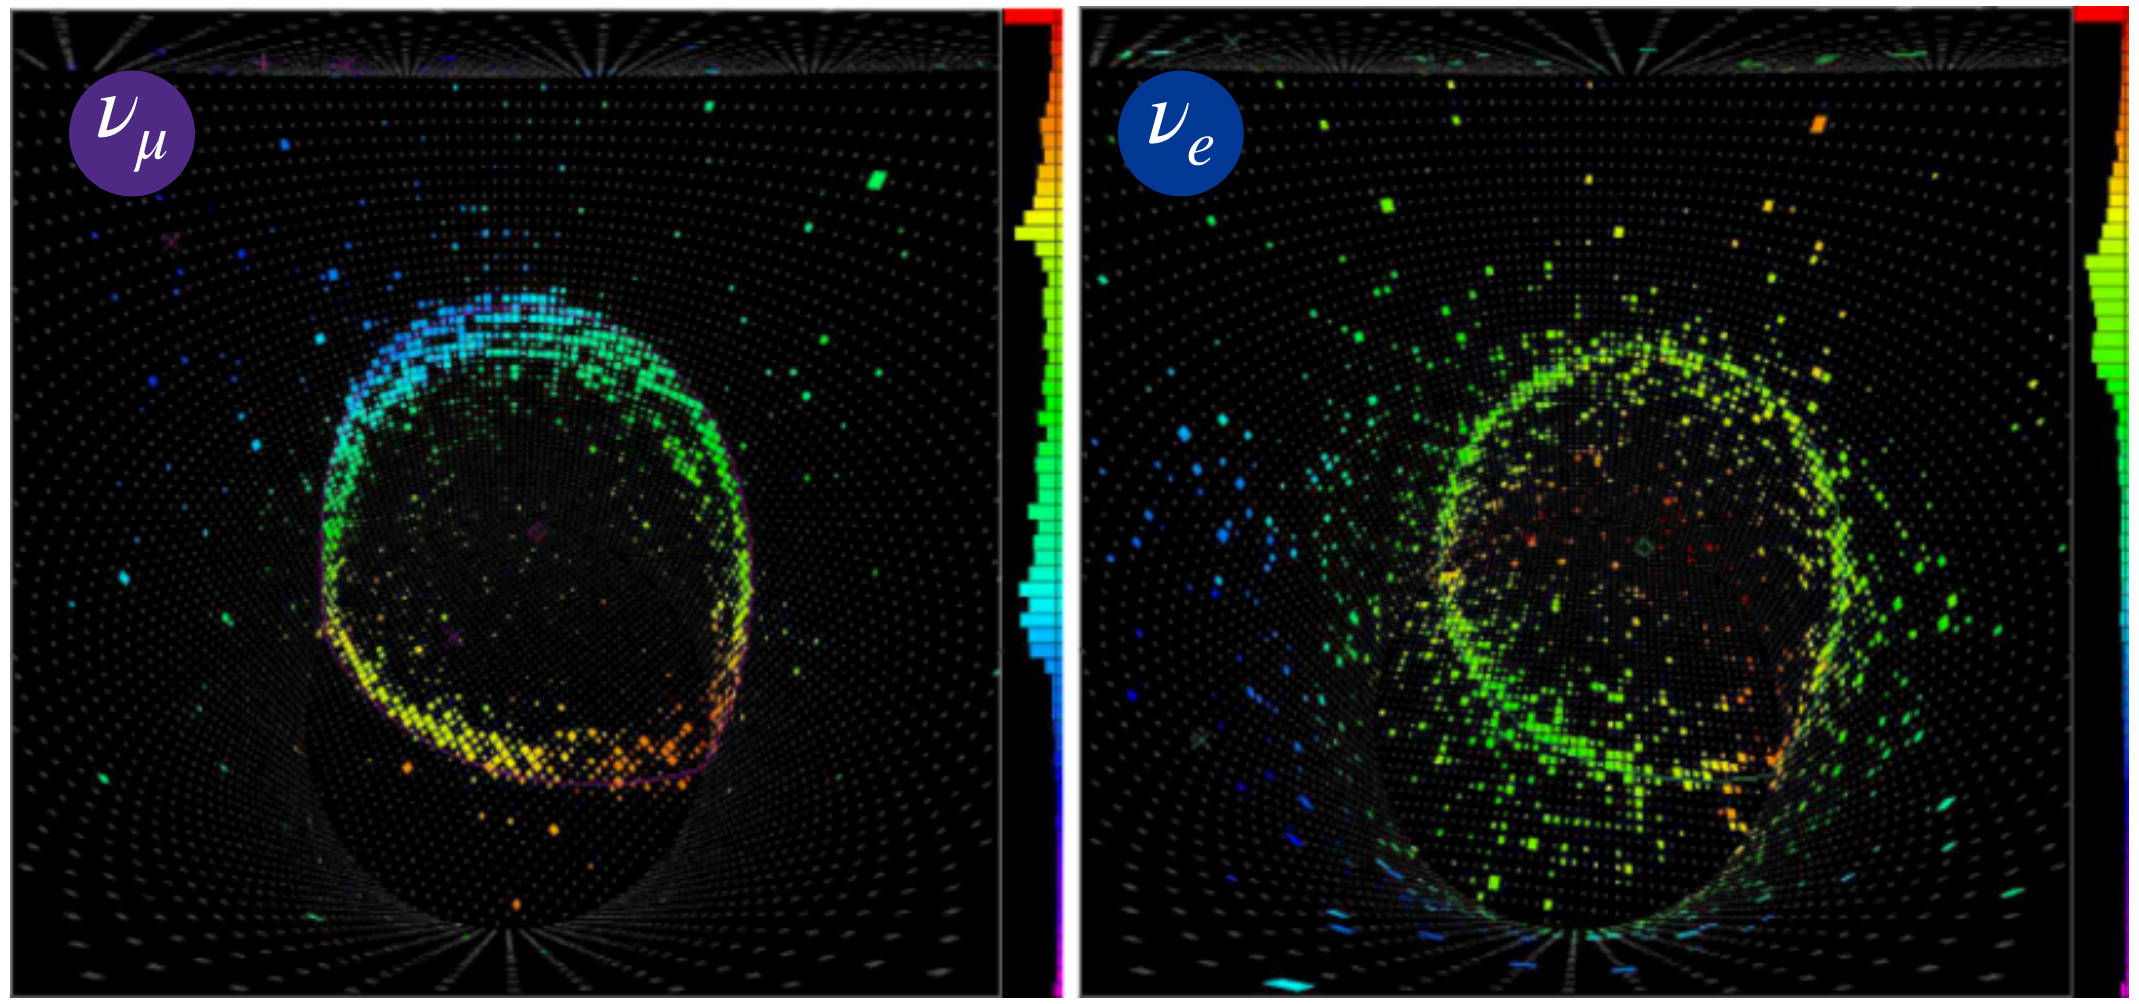
Atmospheric neutrinos

- 1998 Super-Kamiokande (50kton water cherenkov detector, 11146 PMTs) detected atmospheric neutrinos









Atmospheric neutrinos

- 1998 Super-Kamiokande (50kton water cherenkov experiment) detected atmospheric neutrinos

Current knowledge

- Solar mass squared splitting: $\Delta m^2_{21} \sim 7.42 \times 10^{-5}\,\mathrm{eV}^2$
- Atmospheric mass squared splitting: $|\Delta m^2_{3\ell}| \sim 2.515 \times 10^{-3}\,\mathrm{eV}^2$

Normal hierarchy	$m_1 < m_2 < m_3$	$\implies \Delta m^2_{32} > 0,$
Inverted hierarchy	$m_3 < m_1 < m_2$	$\implies \Delta m^2_{32} < 0.$

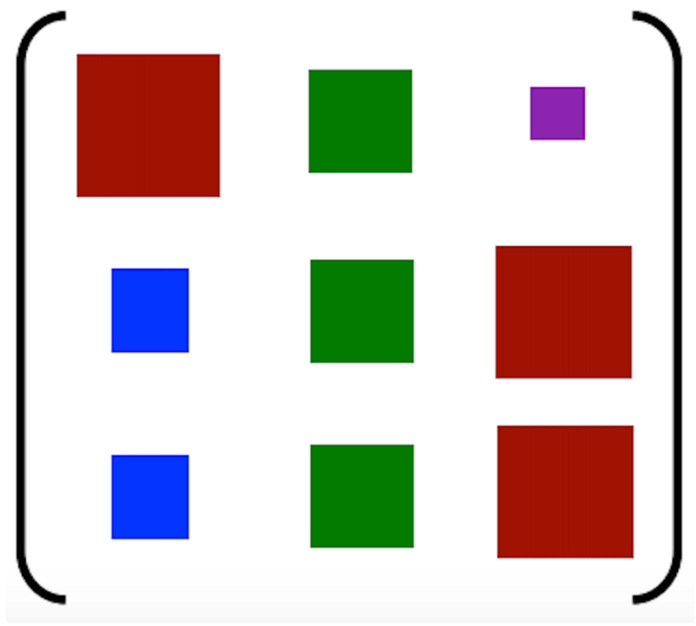
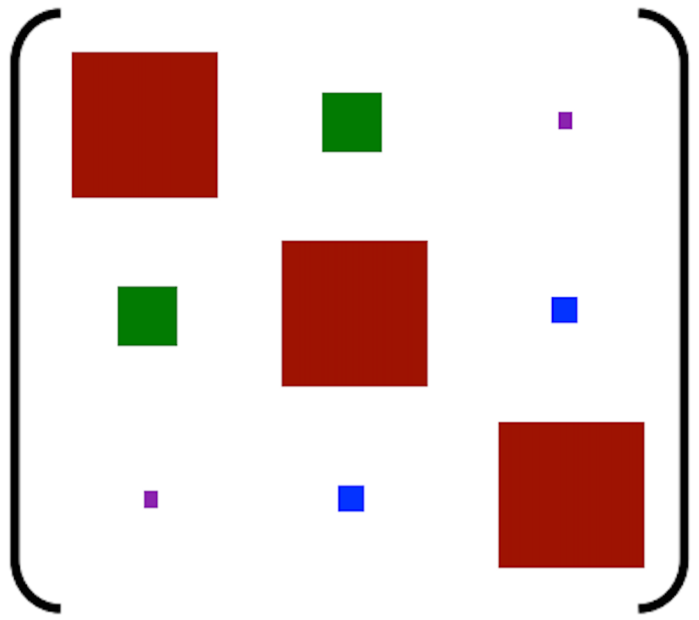
Lepton Sector

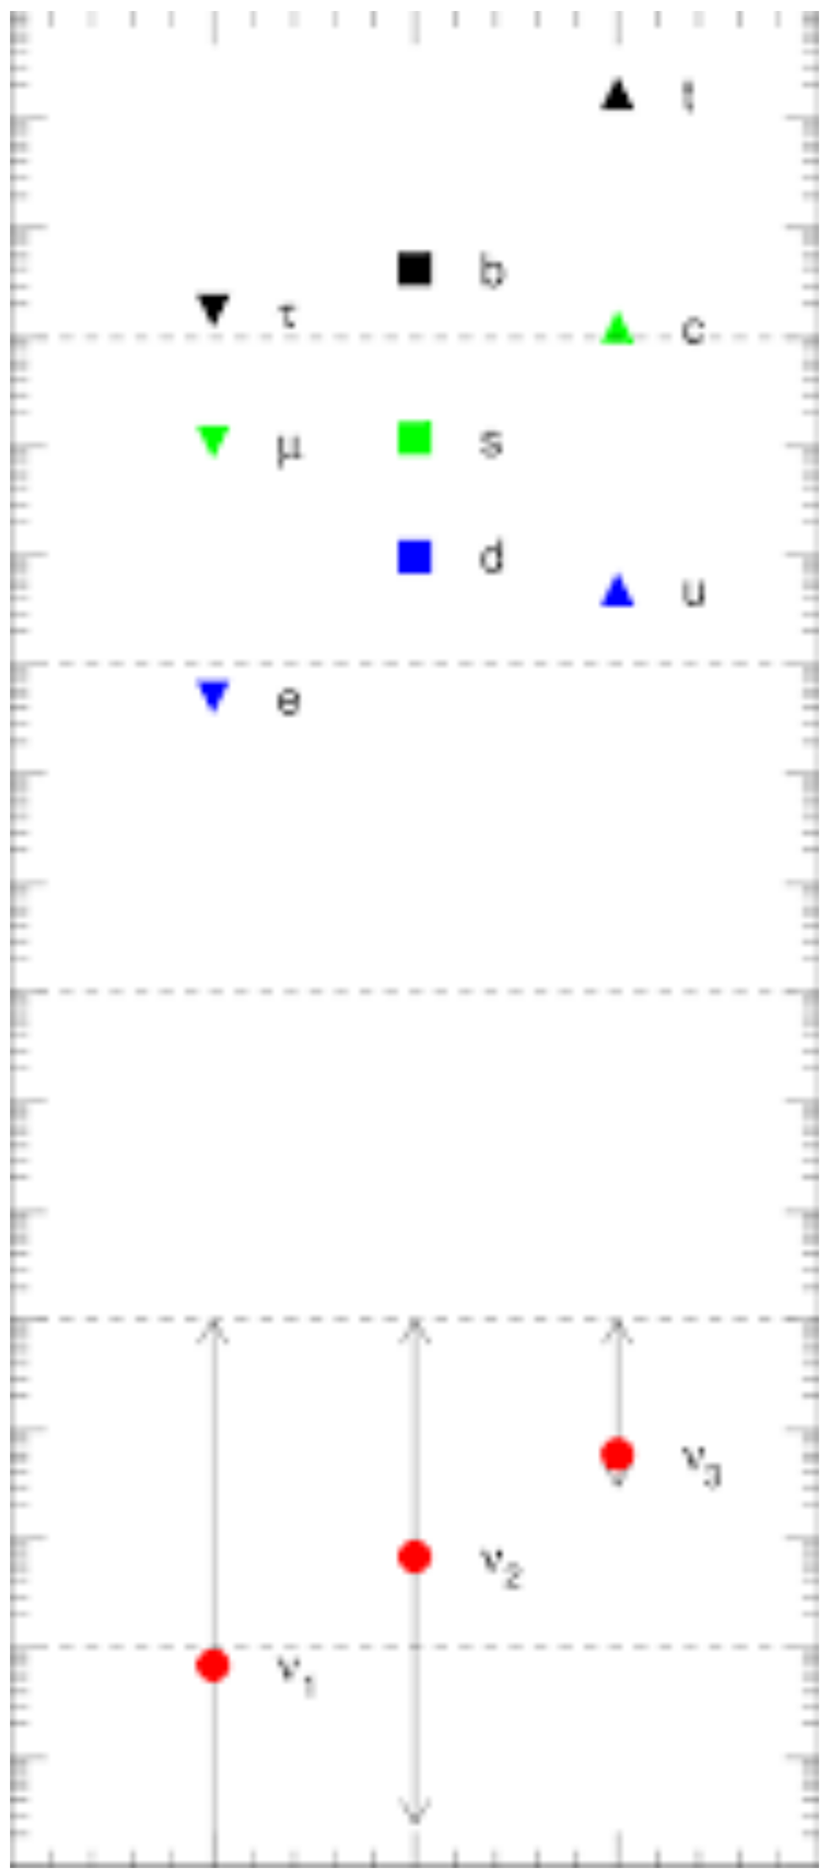


$$\sim \begin{pmatrix} 0.8 & 0.5 & 0.1 \\ 0.4 & 0.5 & 0.7 \\ 0.4 & 0.6 & 0.7 \end{pmatrix}$$

Quark Sector



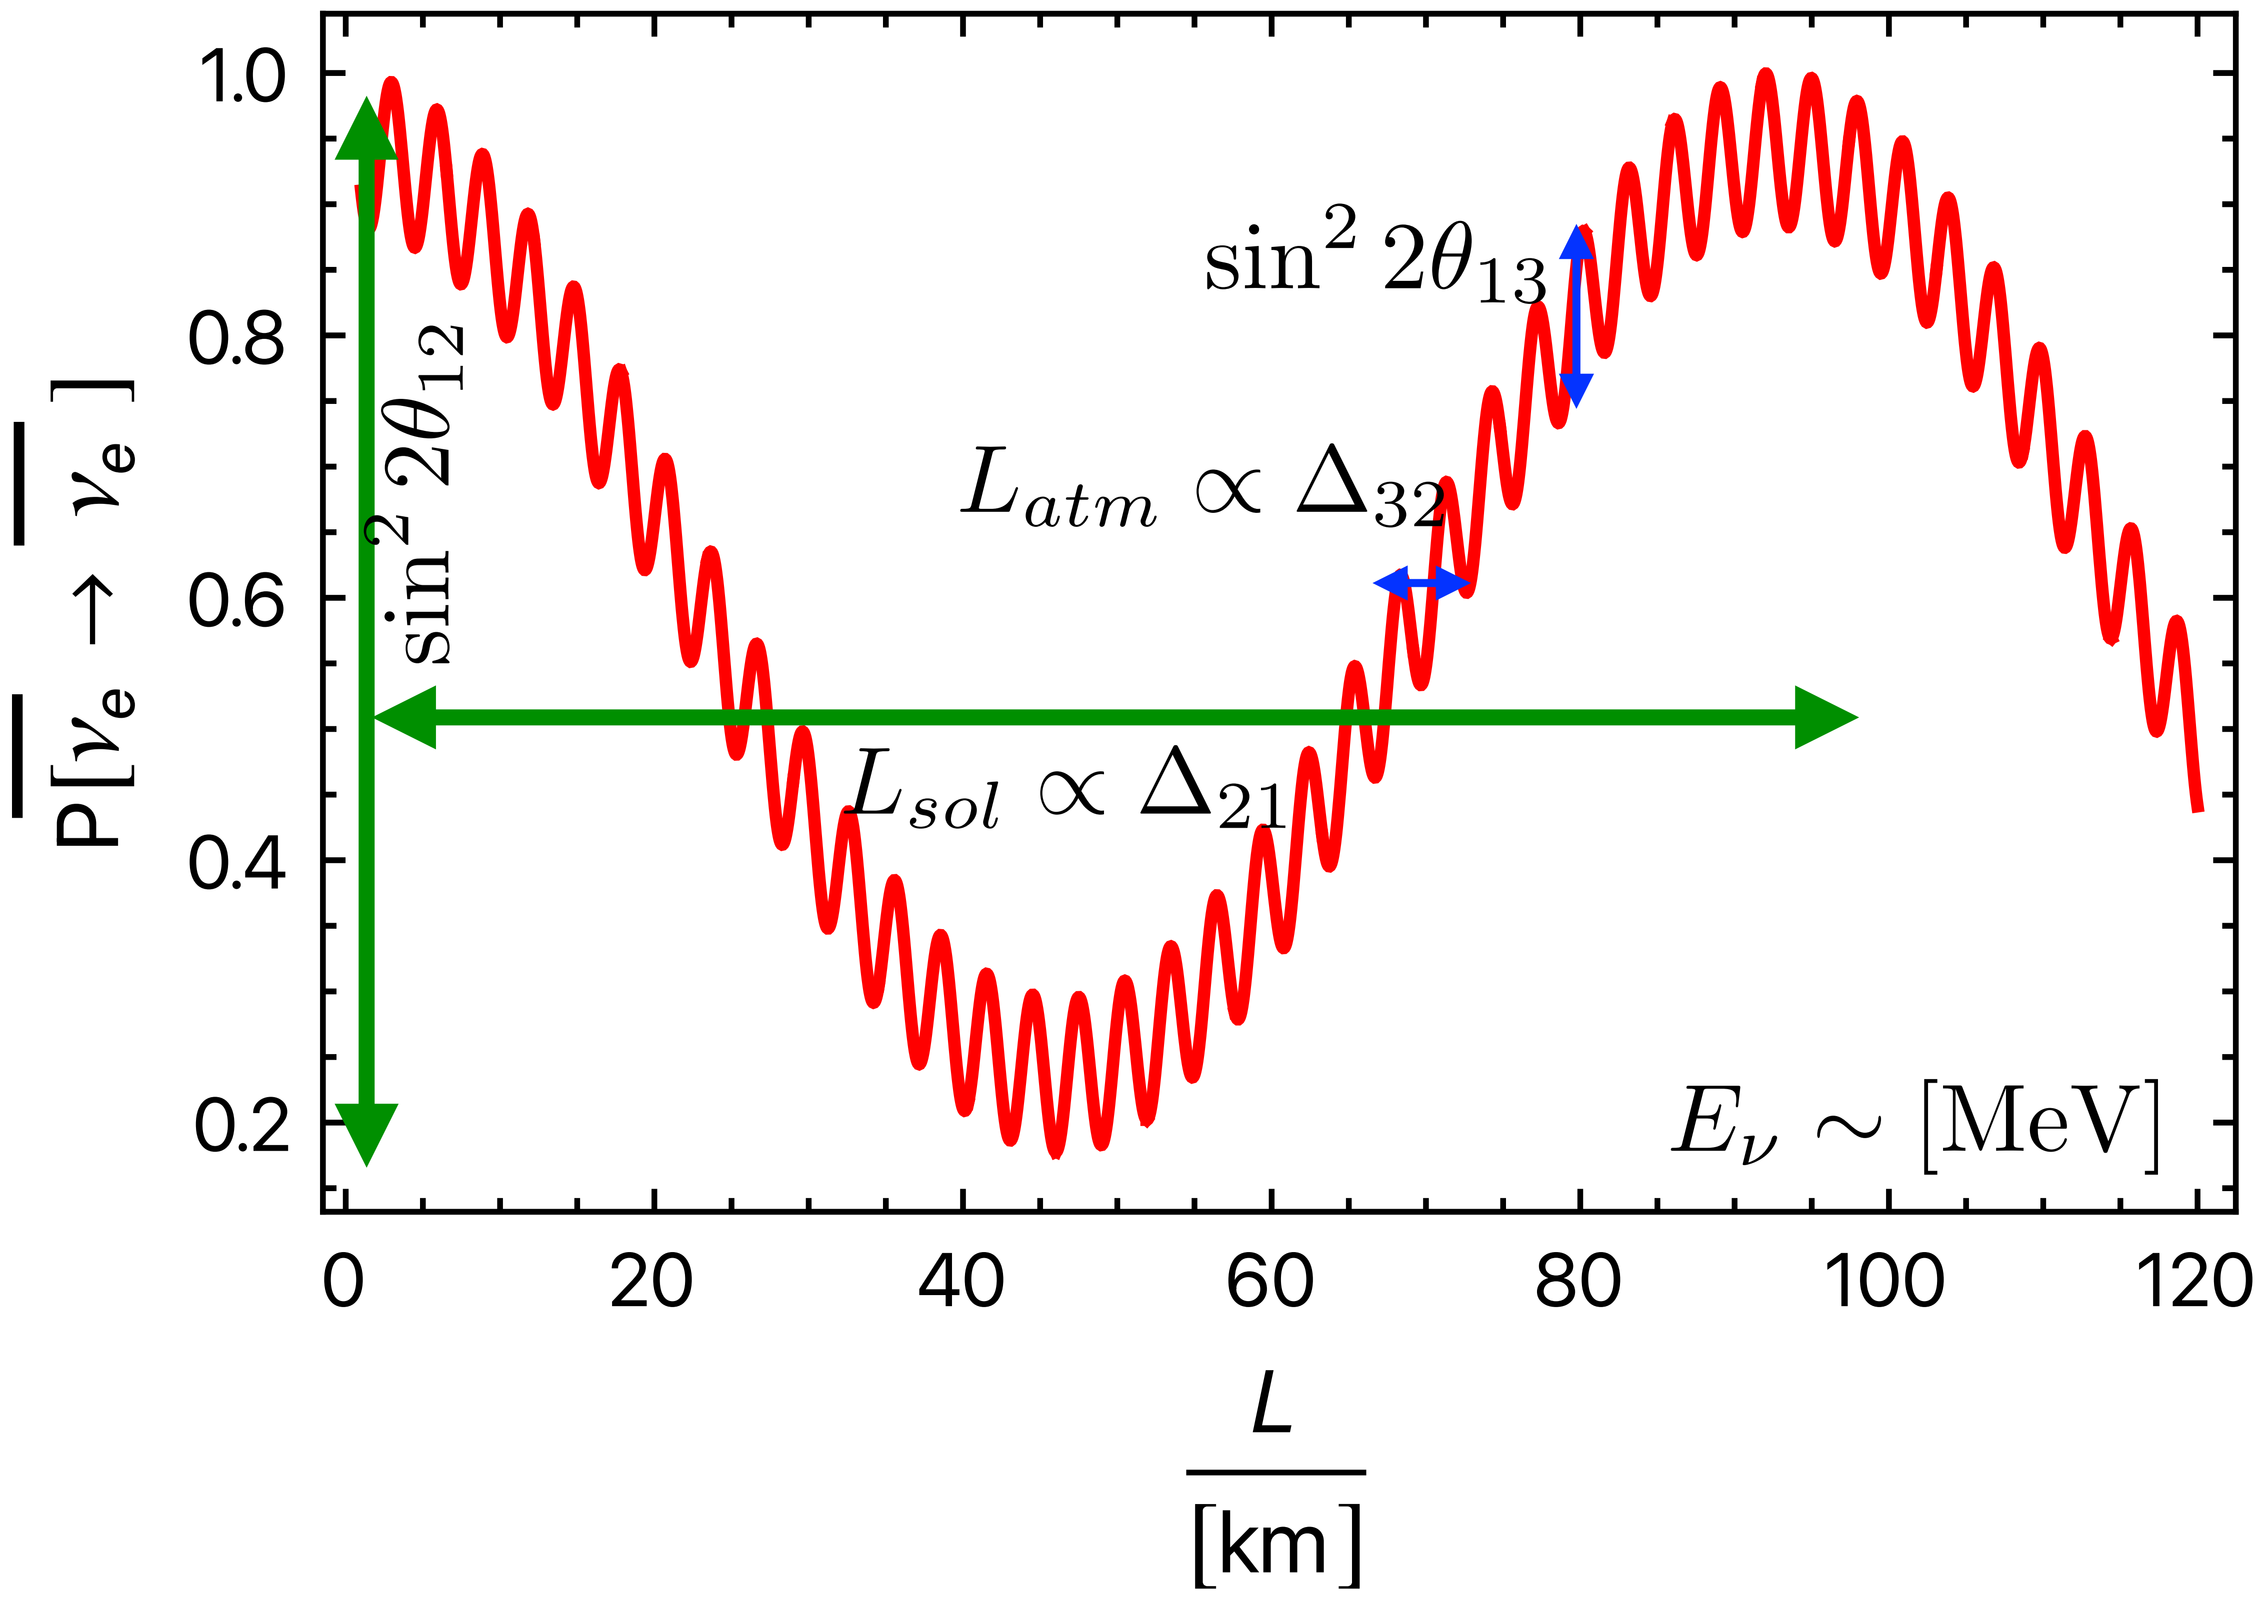
$$\sim \begin{pmatrix} 0.98 & 0.2 & 0.0 \\ 0.2 & 0.99 & 0.0 \\ 0.0 & 0.04 & 1.0 \end{pmatrix}$$



- The mixing and masses of each sector of the SM are so different, better measurements can help us understand why

Neutrino oscillation physics - reactor experiments

$$P(\overline{\nu_e} \rightarrow \overline{\nu_e}) = 1 - \underline{\cos^4\theta_{13}\sin^2 2\theta_{12}\sin^2\Delta_{21}} - \underline{\sin^2 2\theta_{13}\sin^2\Delta_{32}}$$



Consider the wavelength of each contribution

$$\Delta_{ij} = \left(\frac{1.27\Delta m^2_{ij}[\mathrm{eV}^2]L[\mathrm{km}]}{E_\nu[\mathrm{GeV}]}\right)$$

$$\theta_{12} = 30^\circ, \theta_{13} = 8^\circ, \theta_{23} = 45^\circ, E_\nu = 3\mathrm{MeV}$$

$$\Delta^2 m_{21} = 8 \times 10^{-5}\mathrm{eV}^2 \quad \Delta^2 m_{32} = 2.5 \times 10^{-3}\mathrm{eV}^2$$

Oscillation minimum $\Longrightarrow$ orange term maximise

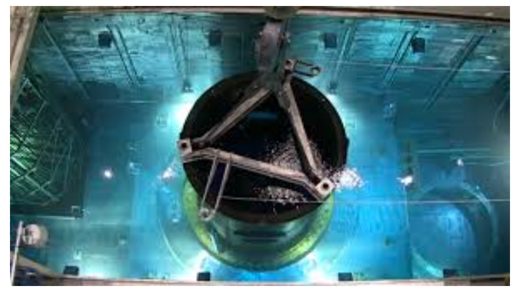
$$\Delta_{ij} = \left(\frac{1.27\Delta m^2_{ij}\left[\mathrm{eV}^2\right]L[\ \mathrm{km}]}{E_\nu[\mathrm{GeV}]}\right) = \frac{\pi}{2}$$

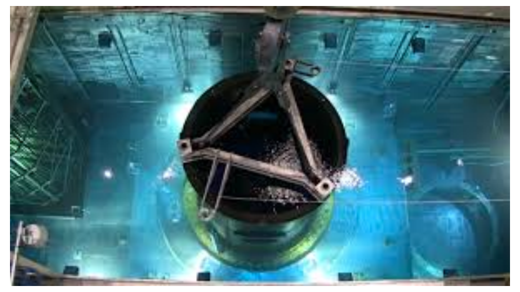
Oscillation minima: $L_{\mathrm{sol}} \approx 46\,\mathrm{km}$, $L_{\mathrm{atm}} \approx 1.5\,\mathrm{km}$

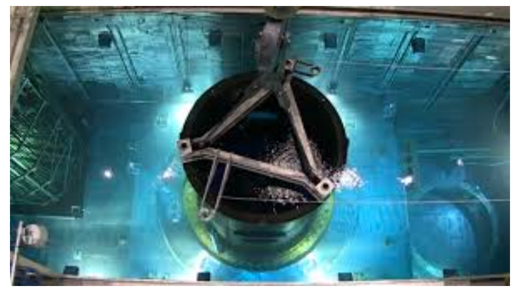
Show that oscillation maximum occurs at $L_{\mathrm{sol}} \sim 94\,\mathrm{km}$

Neutrino oscillation physics - reactor experiments

- KamLand is a medium baseline reactor experiment in same cavern as SK

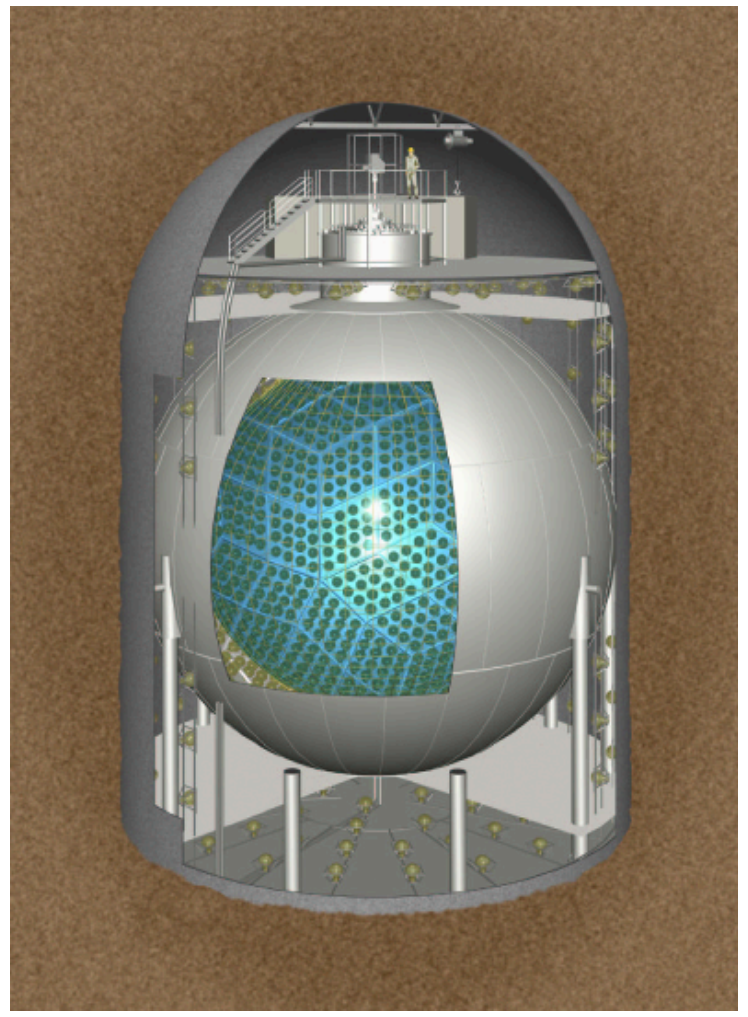




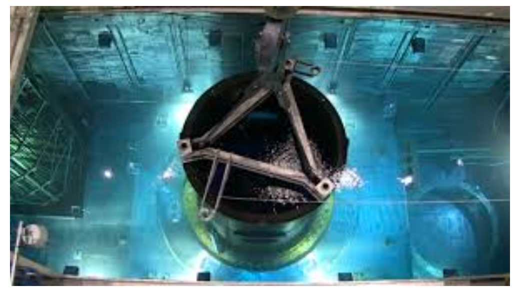


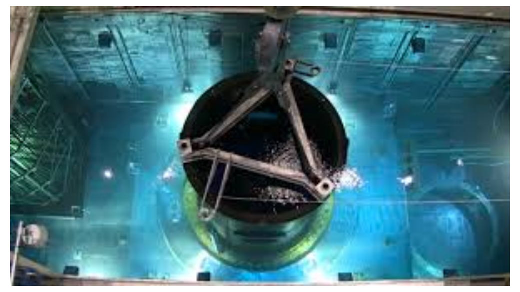
$\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$

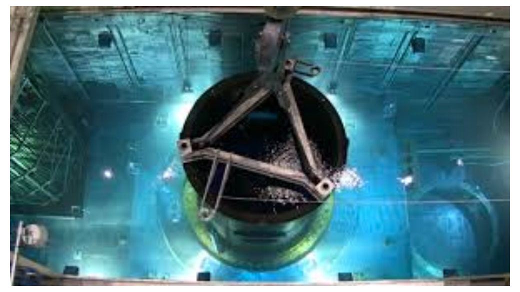
Liquid scintillator 9600 PMTs



$$\overline{\nu}_e + p \rightarrow e^+ + n$$
$$n + p \rightarrow D + \gamma$$





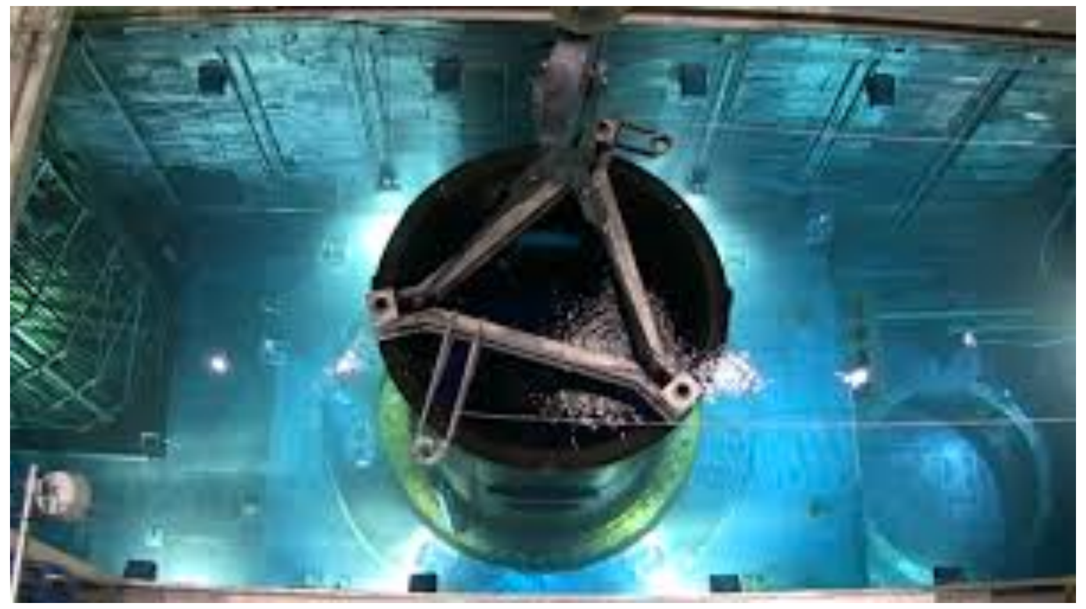


- Baseline between **130 - 240 km**

Neutrino oscillation physics - reactor experiments

- Daya Bay, RENO and Double Chooz measured reactor mixing angle in 2012

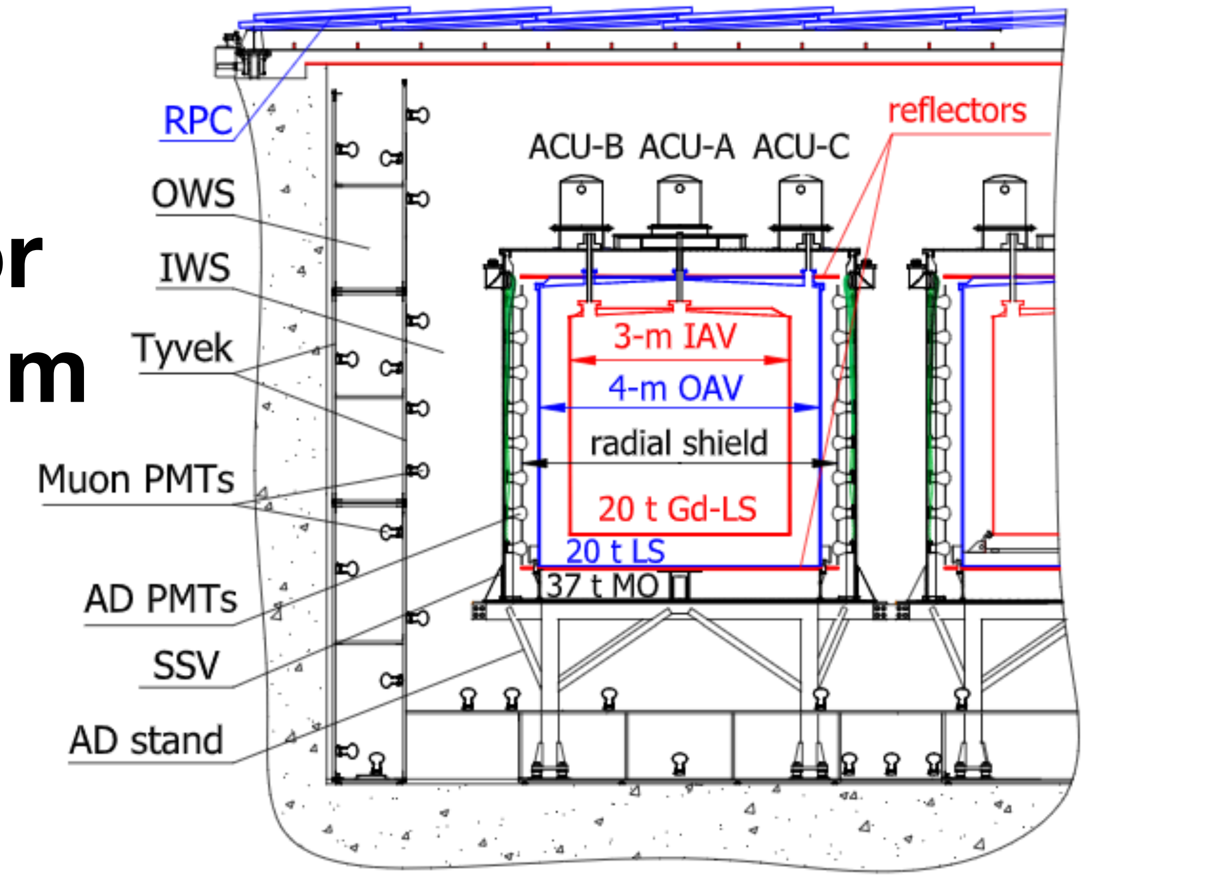
$\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$ $\overline{\nu}_e$



$$\langle E_\nu \rangle \sim \mathrm{MeV}$$

$$4\,\mathrm{km}$$

Liquid scintillator doped Gadolinium



$$\bar{\nu}_e + p \to e^+ + n$$
$$e^+ + e^- \to 2\,\mathrm{prompt}\,\gamma$$
$$\mathrm{Gd} + n \to \mathrm{Gd}^* \to \mathrm{Gd} + \gamma$$

- At such short baselines, the short wavelength term dominates

$$P(\overline{\nu_e} \to \overline{\nu_e}) = 1 - \cos^4\theta_{13}\sin^2 2\theta_{12}\sin^2\Delta_{21} - \underline{\sin^2 2\theta_{13}\sin^2\Delta_{32}}$$

$$P\left(\overline{\nu_e} \to \overline{\nu_e}\right) \approx 1 - \sin^2 2\theta_{13}\sin^2\Delta_{32}$$

Neutrino oscillation physics - reactor experiments

- Medium baseline $\Longrightarrow$ KamLand cannot resolve short wavelength oscillations:

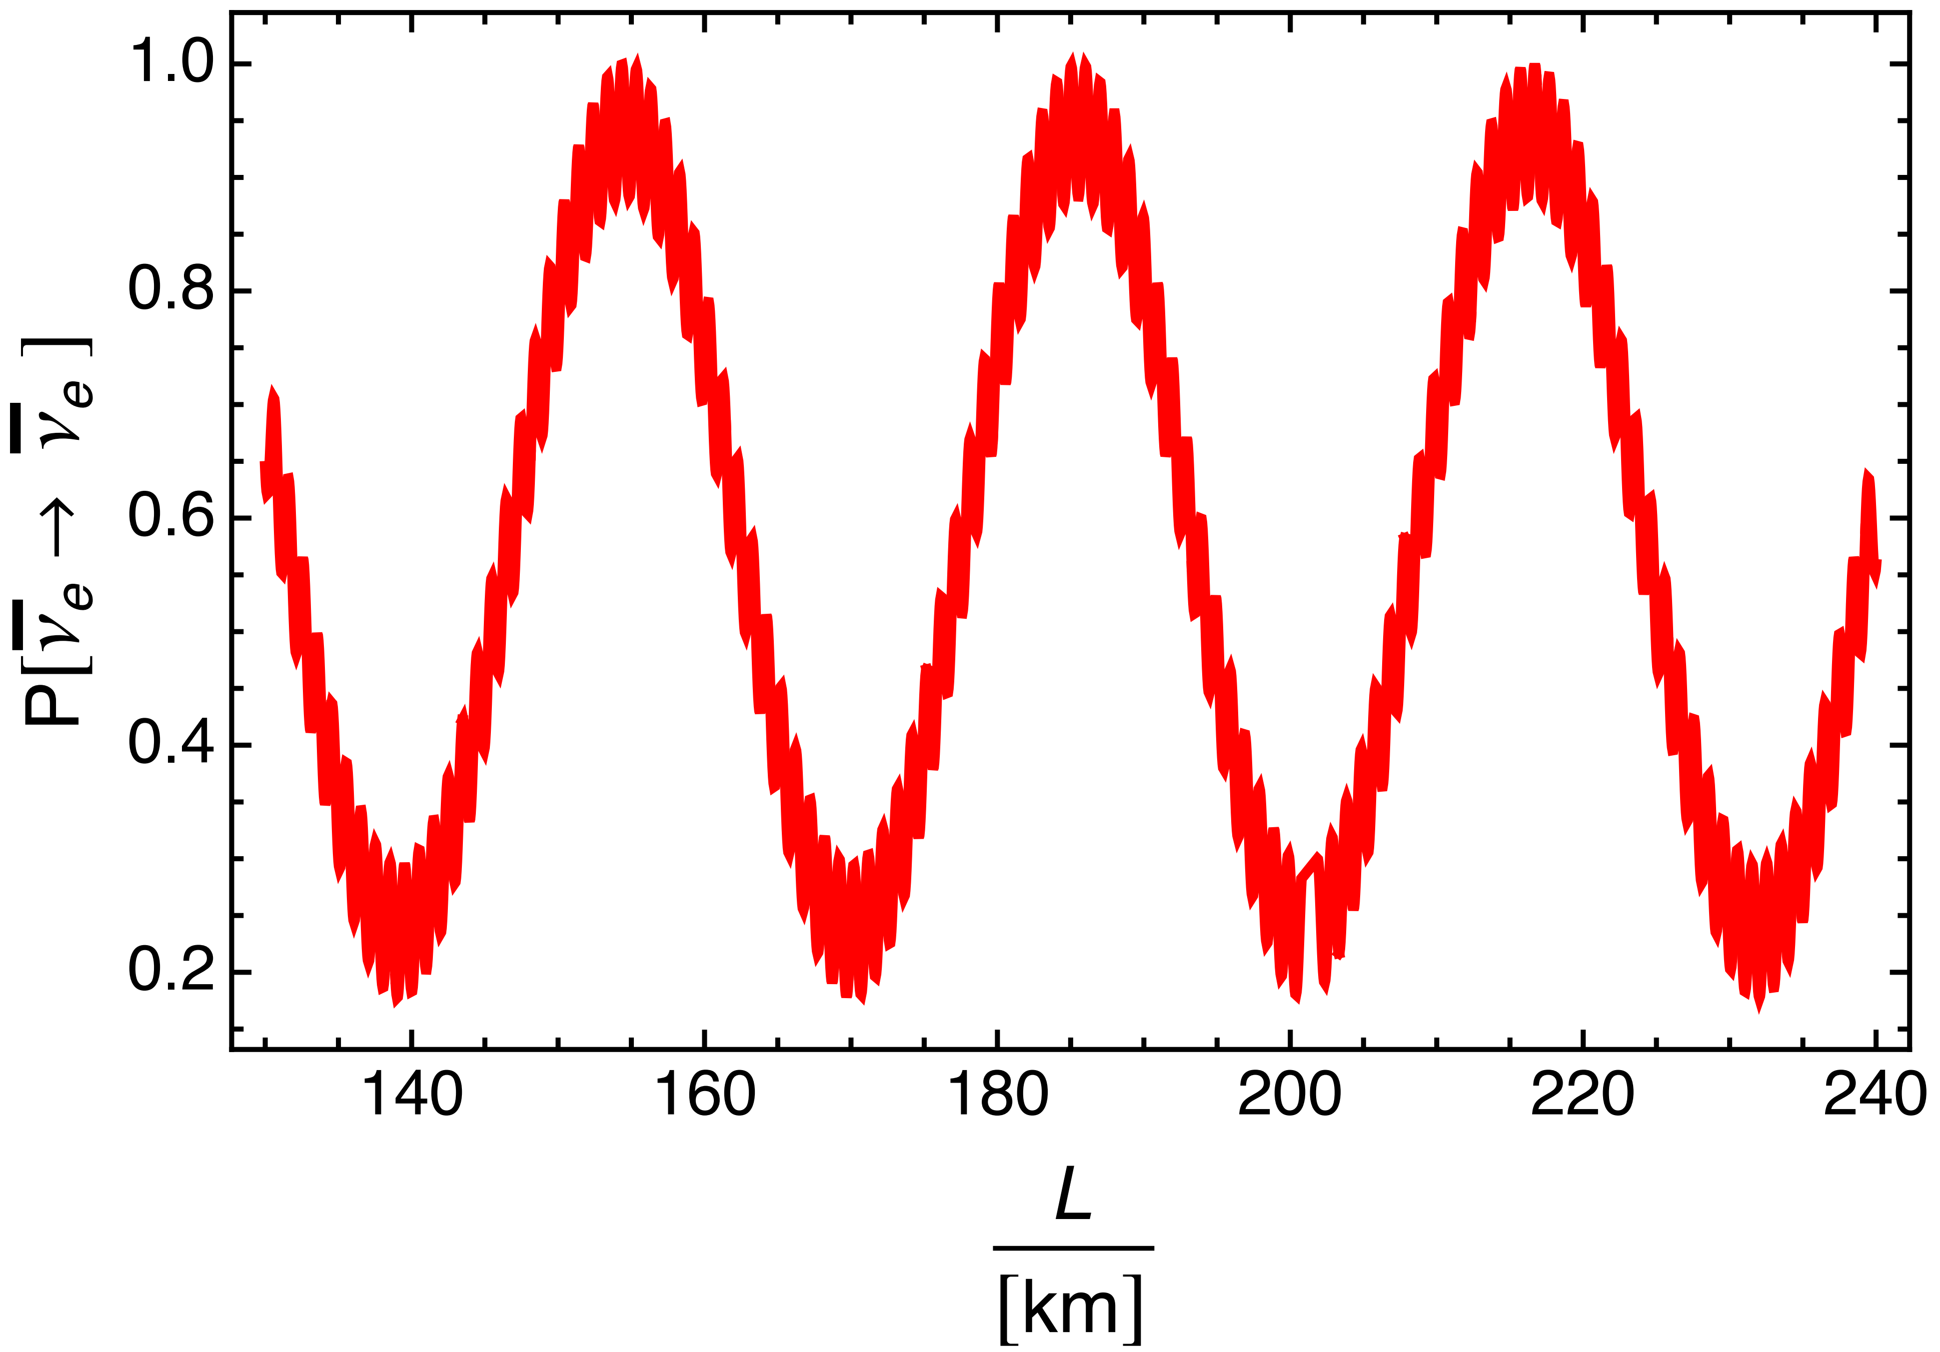
$$P\left(\overline{\nu_e} \to \overline{\nu_e}\right) = 1 - \cos^4\theta_{13}\sin^2 2\theta_{12}\sin^2\Delta_{21} - \sin^2 2\theta_{13}\sin^2\Delta_{32}$$

$$\approx \underbrace{\cos^4\theta_{13}}_{\sim 1}\left(1 - \sin^2 2\theta_{12}\sin^2\Delta_{21}\right)$$

$$1 - \frac{1}{2}\sin^2 2x = \cos(x)^4 + \sin(x)^4$$

neglect $\mathcal{O}(\sin^4(\theta_{13}))$

$$\langle\sin^2\Delta_{32}\rangle = \frac{1}{2}$$

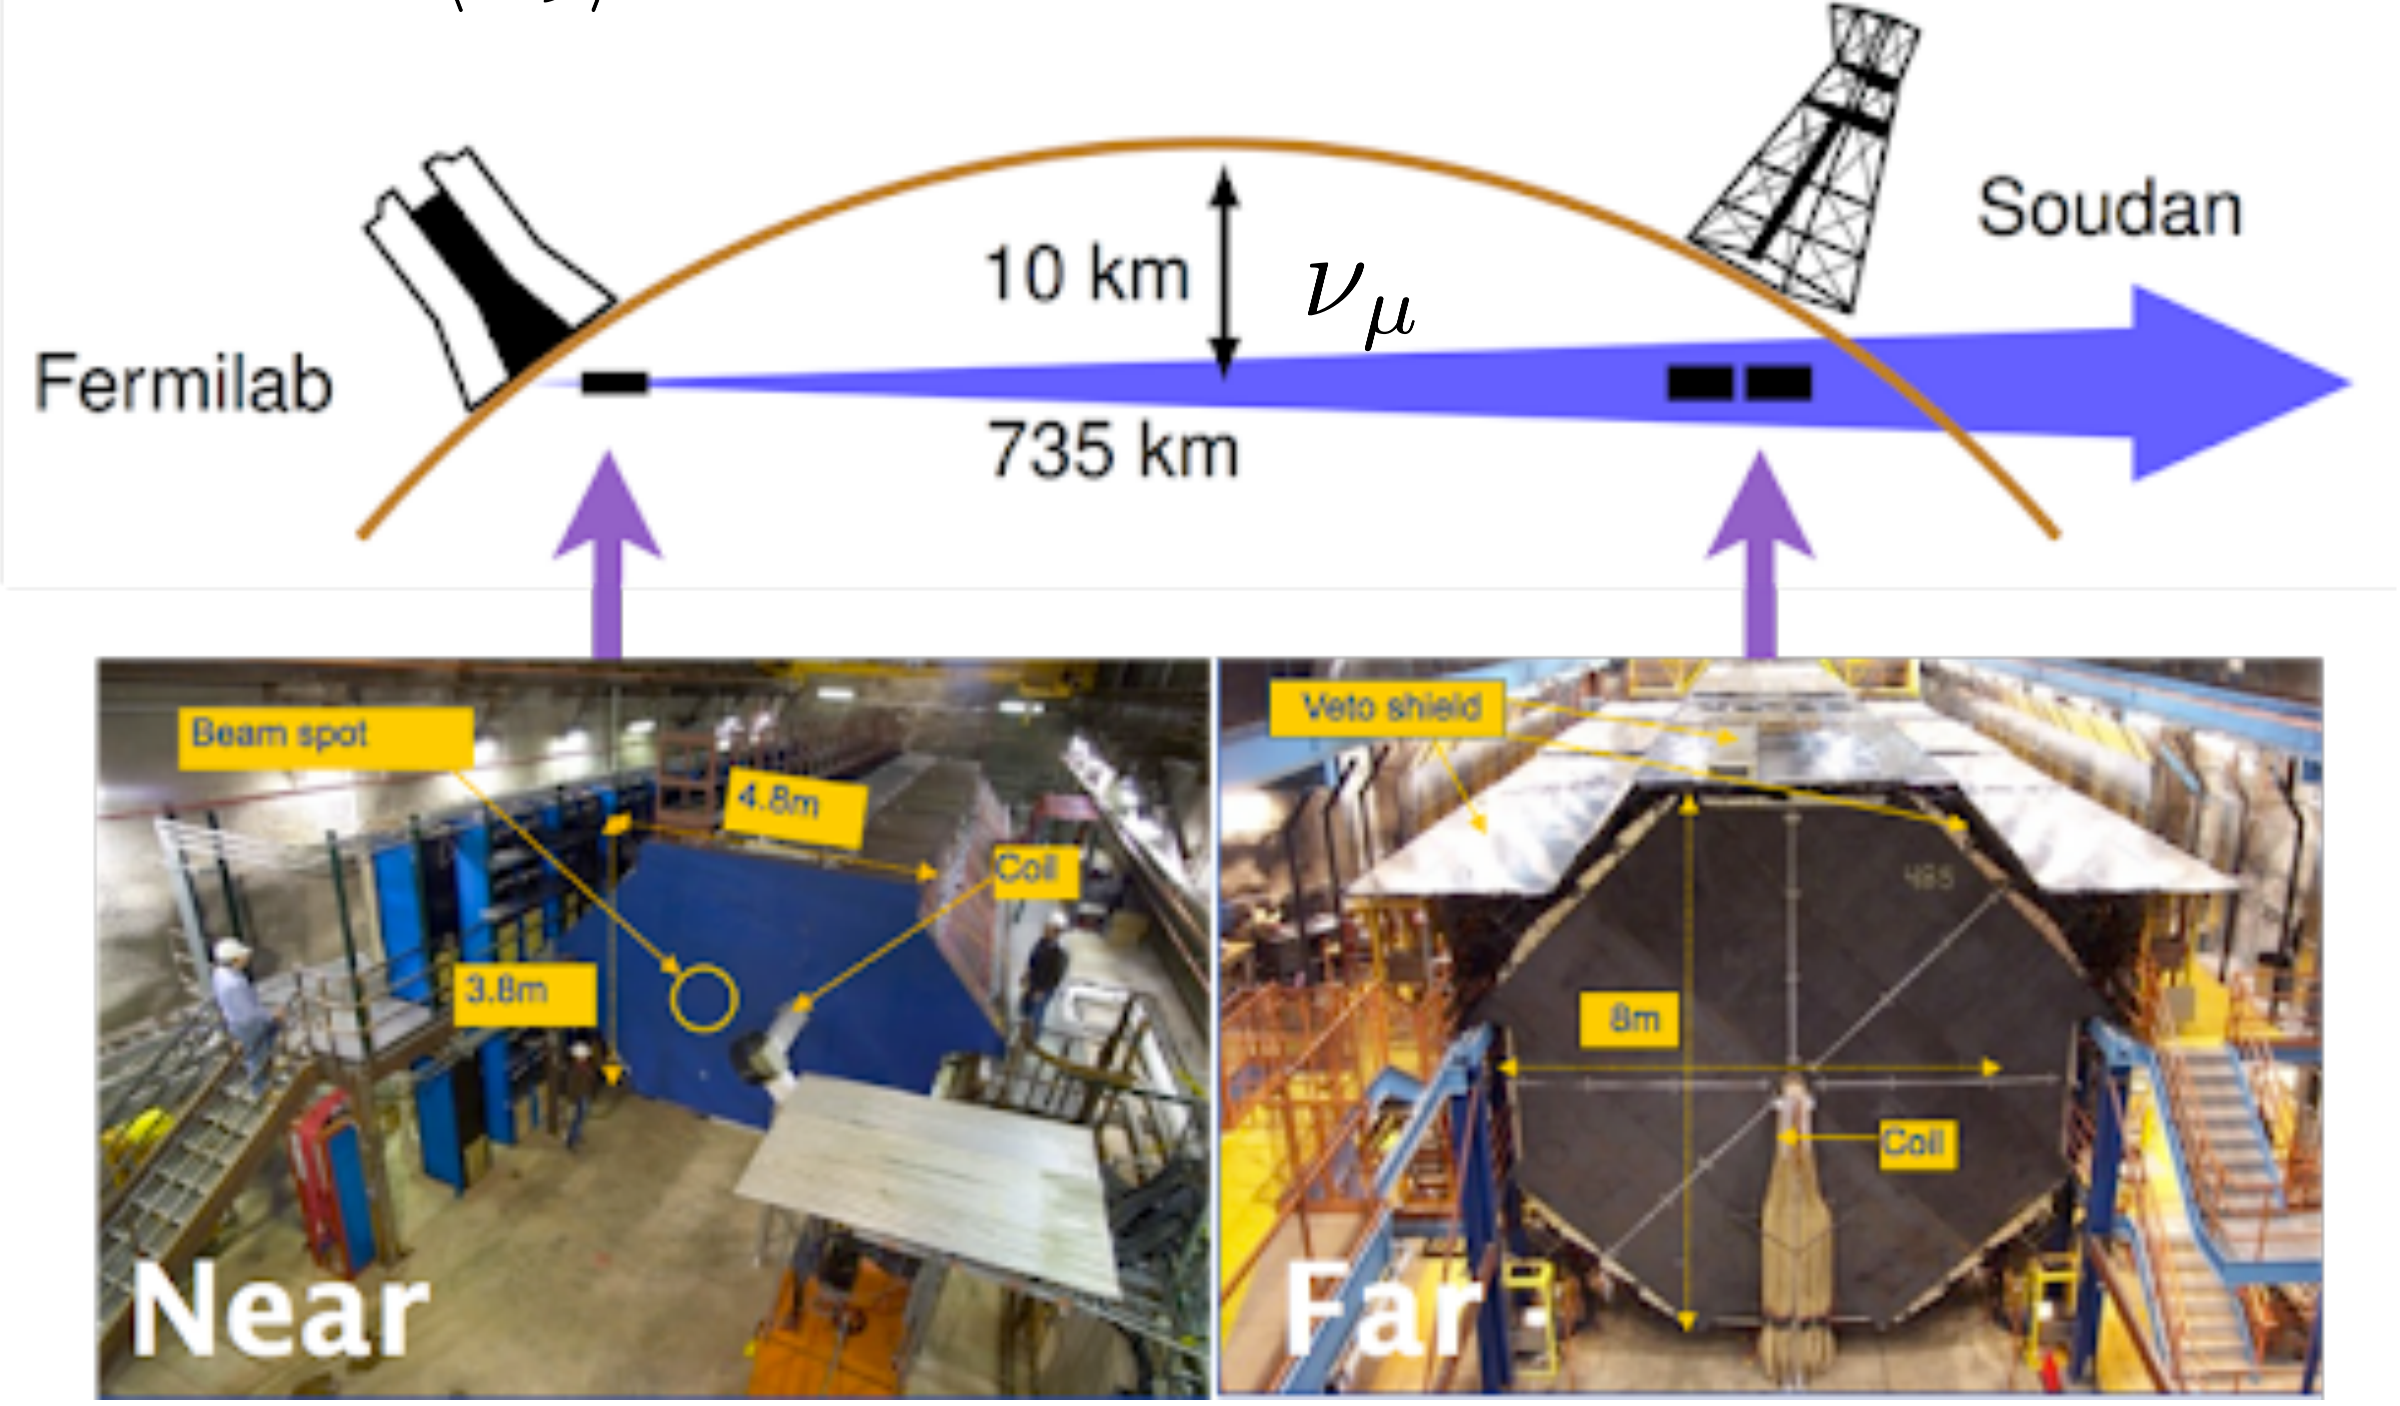


- Survival probability KamLand measures $\theta_{12},\ \Delta m^2_{21}$

Neutrino oscillation physics - accelerator experiments

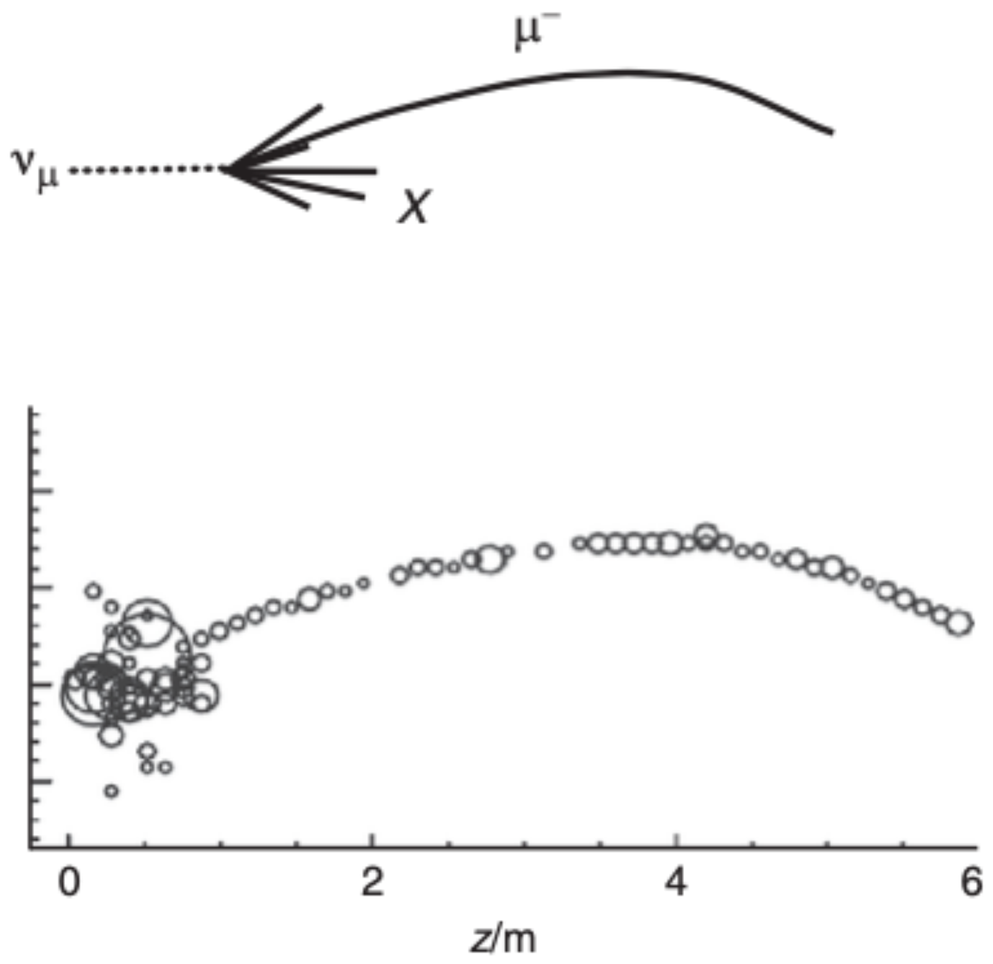
- Long baseline accelerator experiment such as **MINOS**, NOvA and T2K can determine the atmospheric angle and mass squared splitting.

$\langle E_\nu \rangle \sim \text{GeV}$



FD planes of iron 4cm wide plastic scintillator strips

Magnetised momentum muon from CC interactions



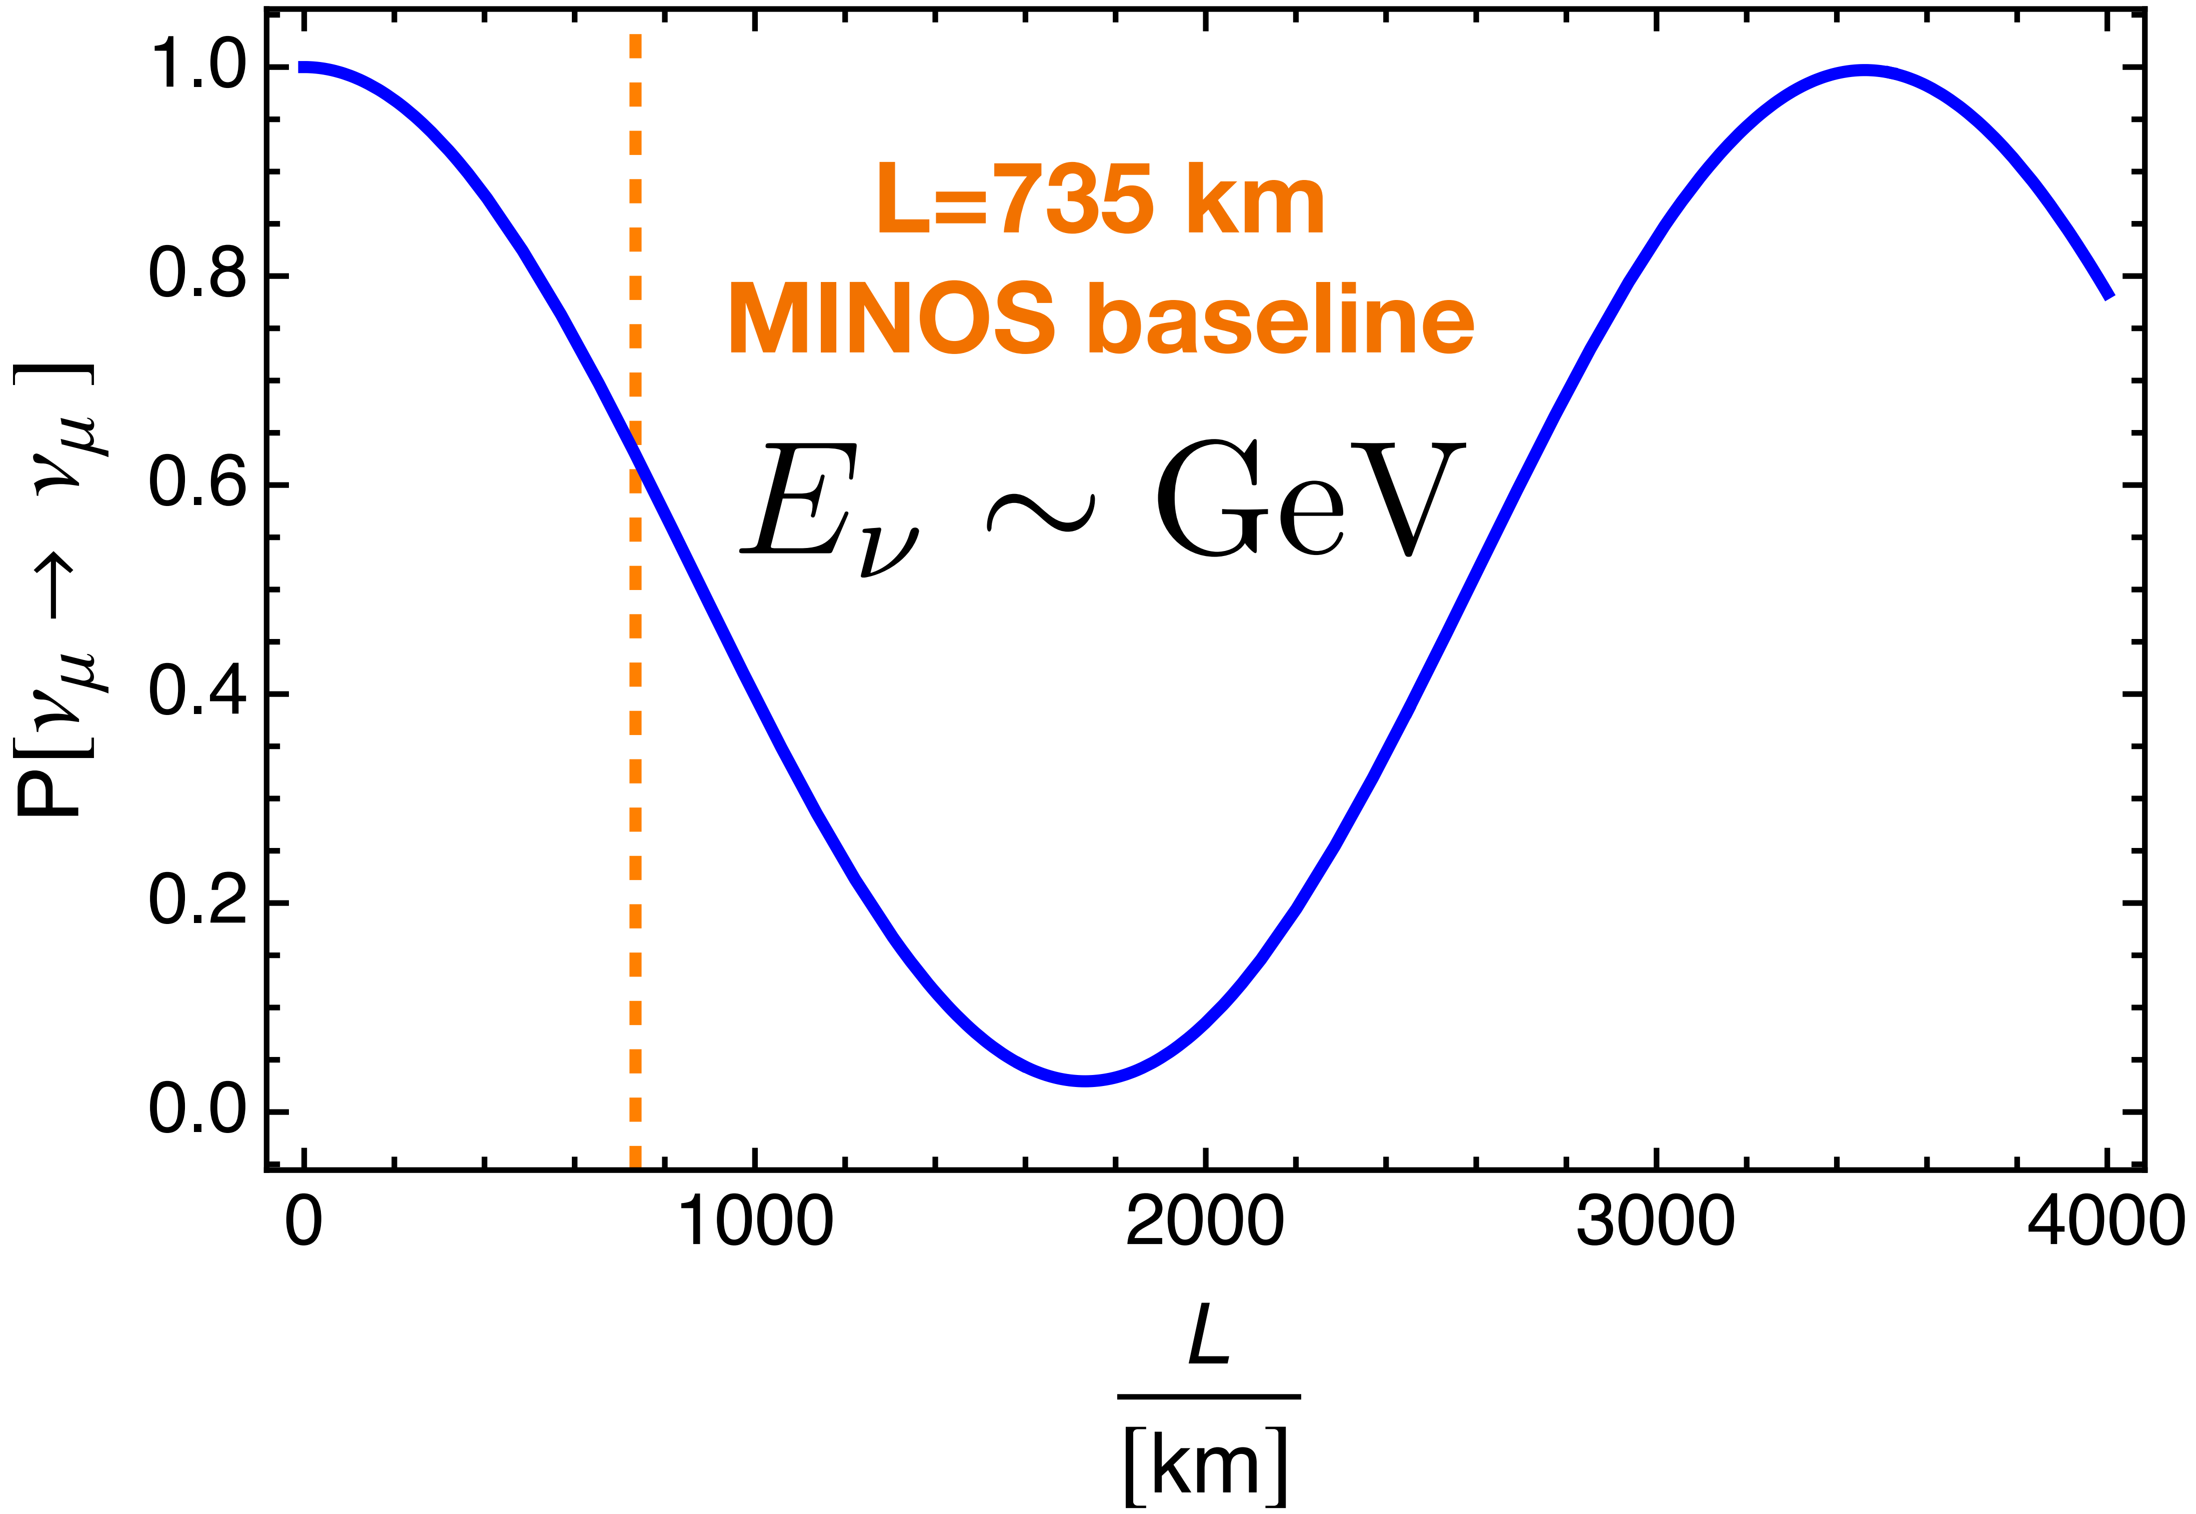
Size of circle indicates amount light recorded In scintillators in MINOS

Neutrino oscillation physics - accelerator experiments

- Long baseline accelerator experiment: MINOS, NOvA and T2K determine the **atmospheric angle** and **mass squared splitting**.

$$
\begin{aligned}
P\left(v_\mu \to v_\mu\right) &= 1 - 4\sin^2\left(\theta_{23}\right)\cos^2\left(\theta_{13}\right)\left[1-\sin^2\left(\theta_{23}\right)\cos^2\left(\theta_{13}\right)\right]\sin^2\Delta_{32} \\
&= 1 - \left[\underline{\sin^2\left(2\theta_{23}\right)\cos^2\left(\theta_{13}\right)} + \sin^2\left(2\theta_{13}\right)\sin^2\left(\theta_{23}\right)\right]\sin^2\Delta_{32}
\end{aligned}
$$

dominant term since reactor mixing angle small



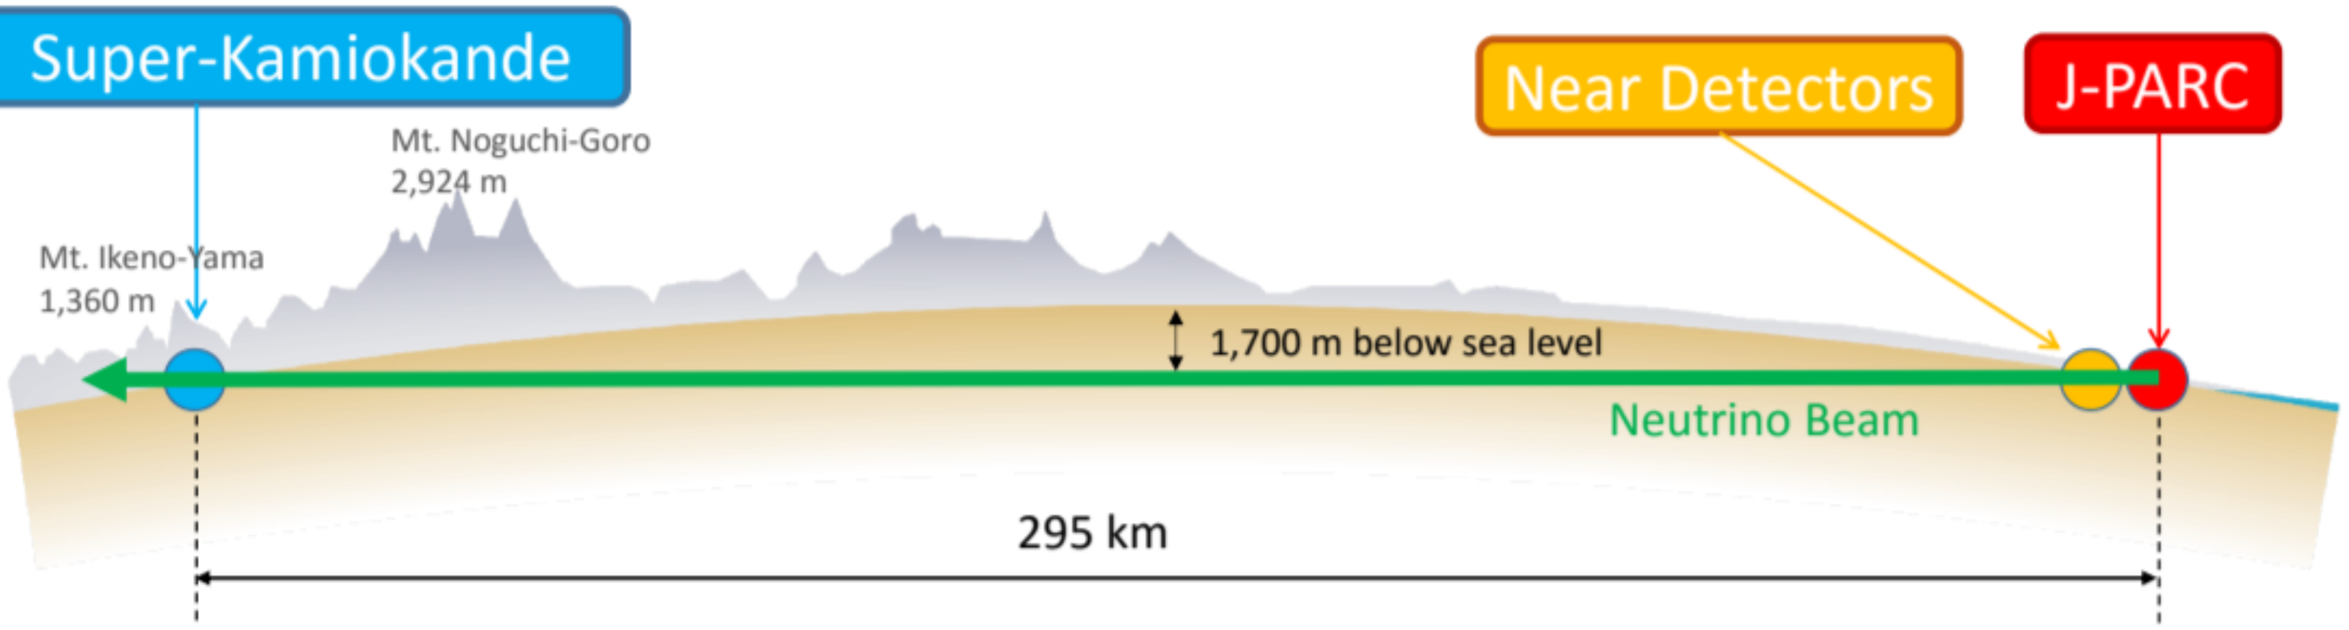
Neutrino oscillation physics - CP-violation

- To observe CP-violation $\Longrightarrow$ difference between an oscillation process and its CP-conjugate process:

$$(\nu_\mu \to \nu_e) \xrightarrow{\text{CP}} (\overline{\nu_\mu} \to \overline{\nu_e})$$

$$P(\nu_\mu \to \nu_e) - P(\overline{\nu_\mu} \to \overline{\nu_e}) \propto \mathrm{Im}\left[U_{e1}^* U_{\mu 1} U_{e2} U_{\mu 2}^*\right] \sin\Delta_{12} \sin\Delta_{13} \sin\Delta_{23}$$

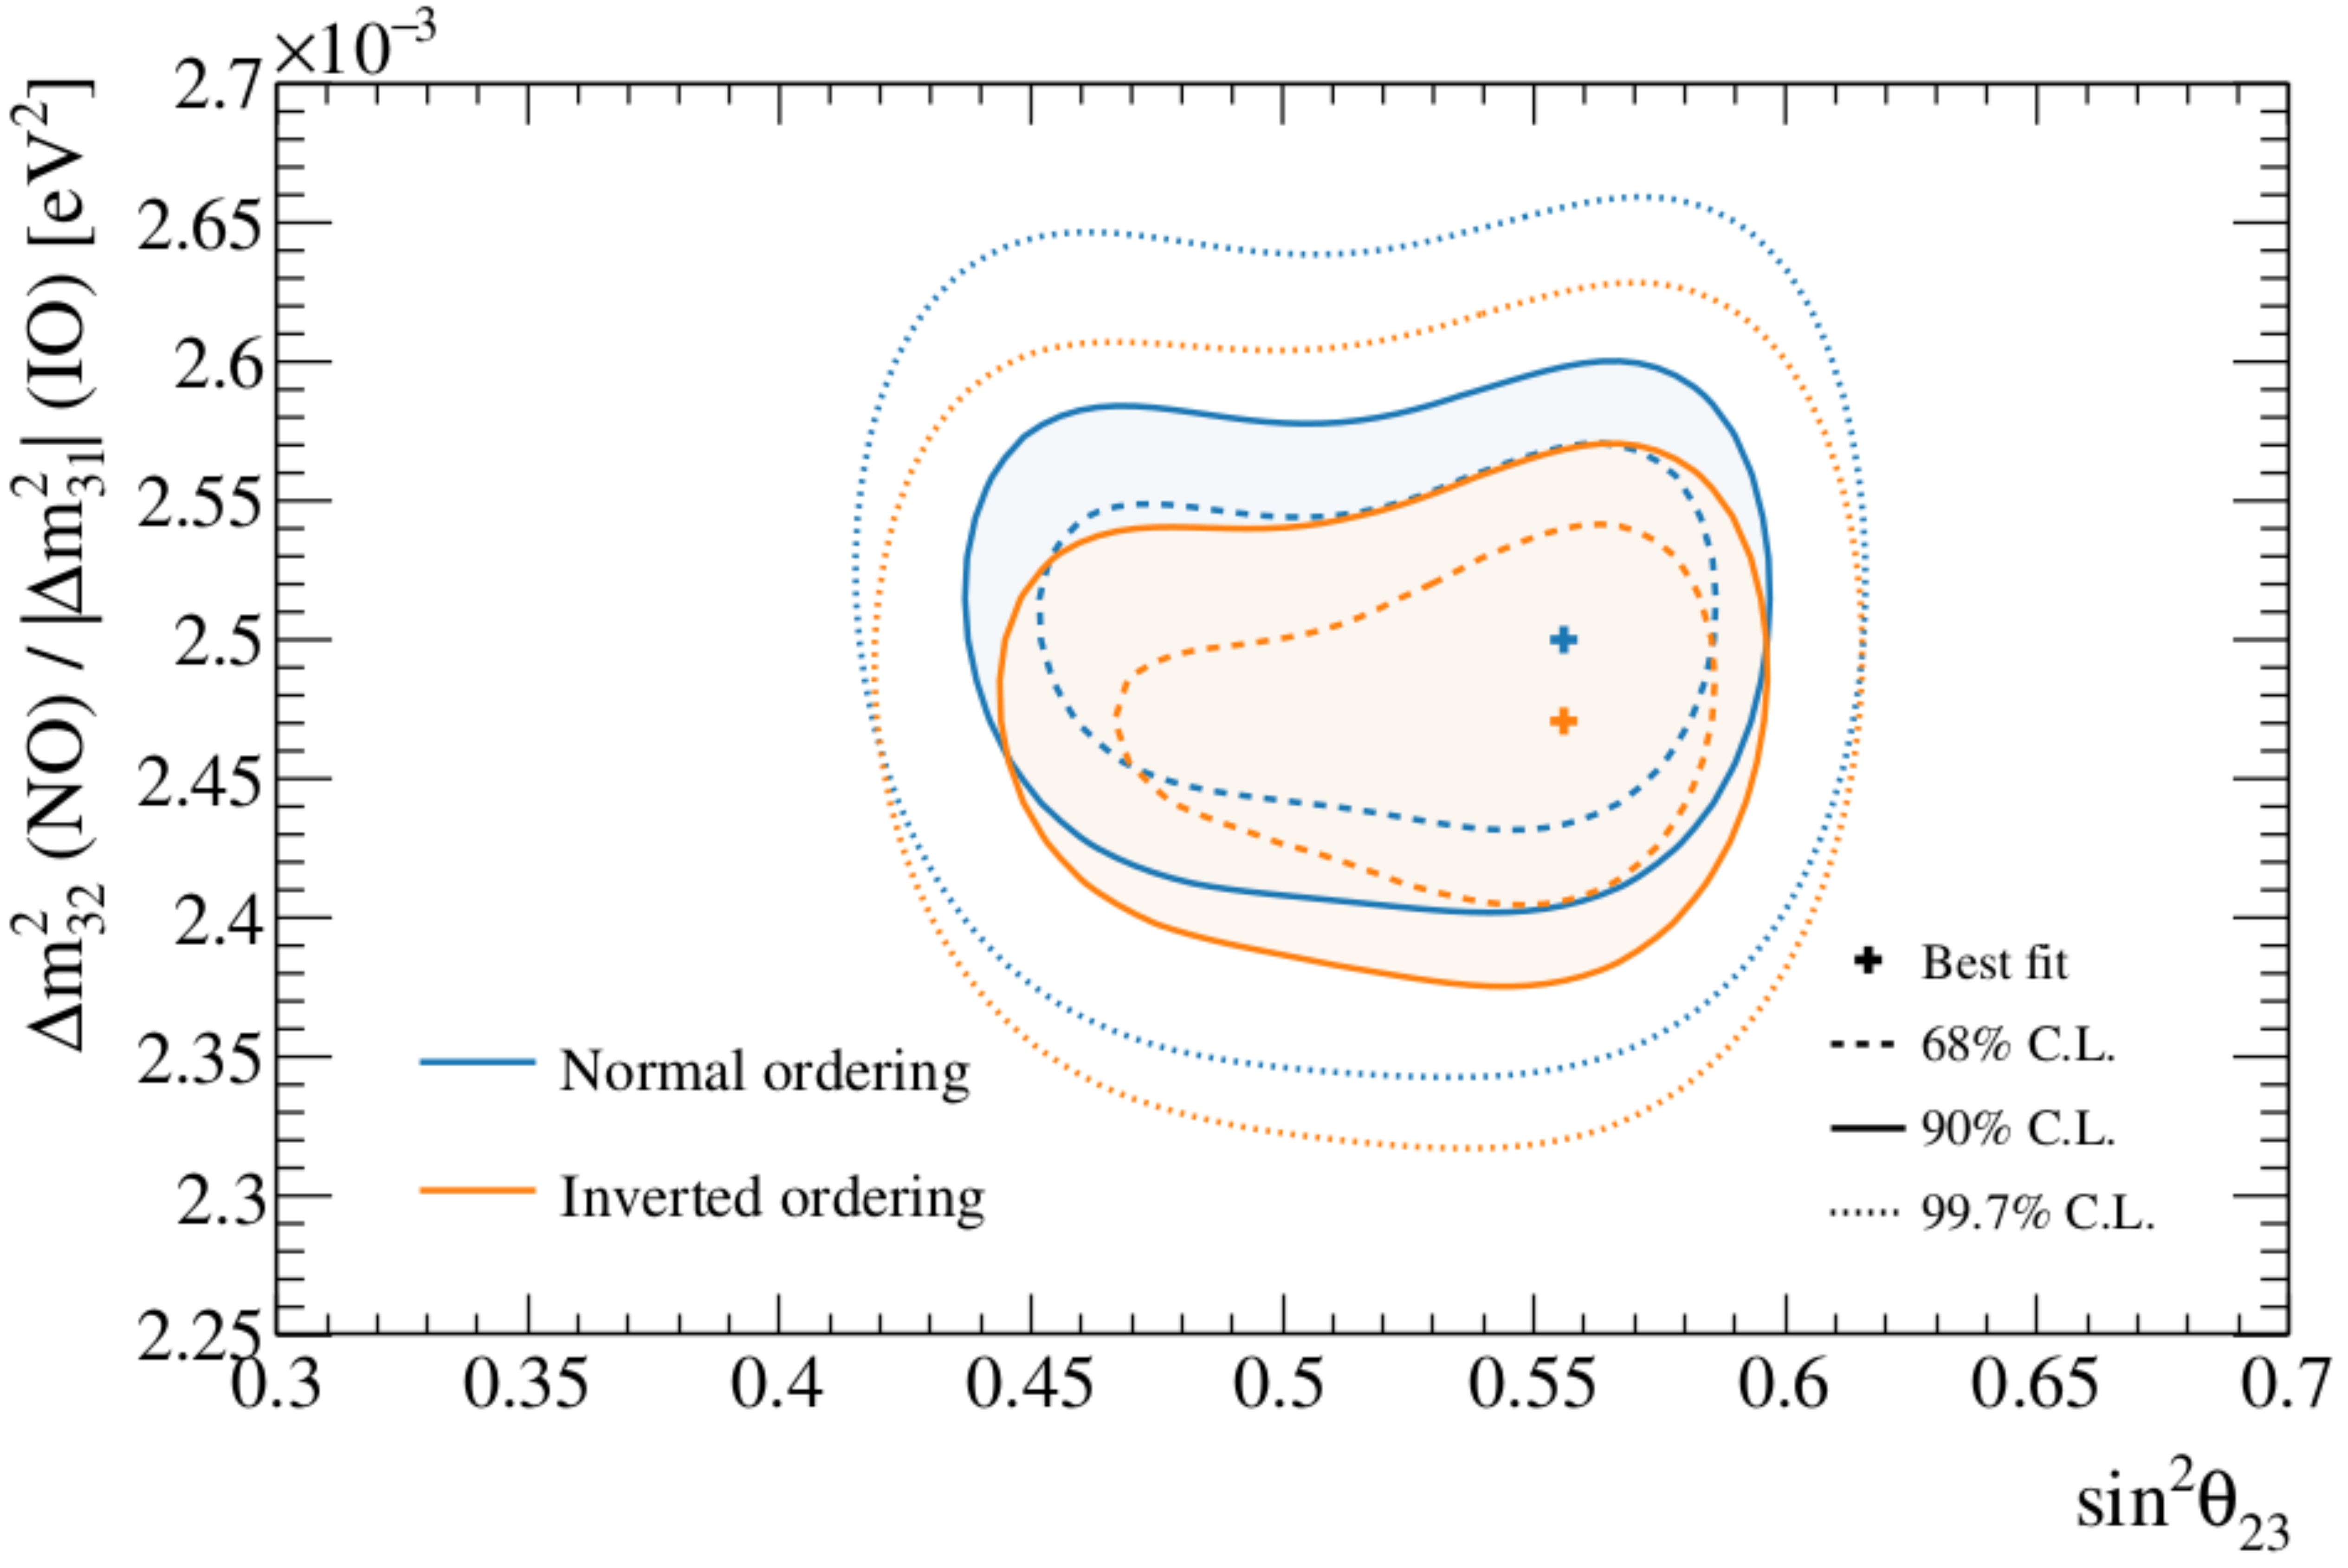
- What is the current status of CP-violation in the neutrino sector?

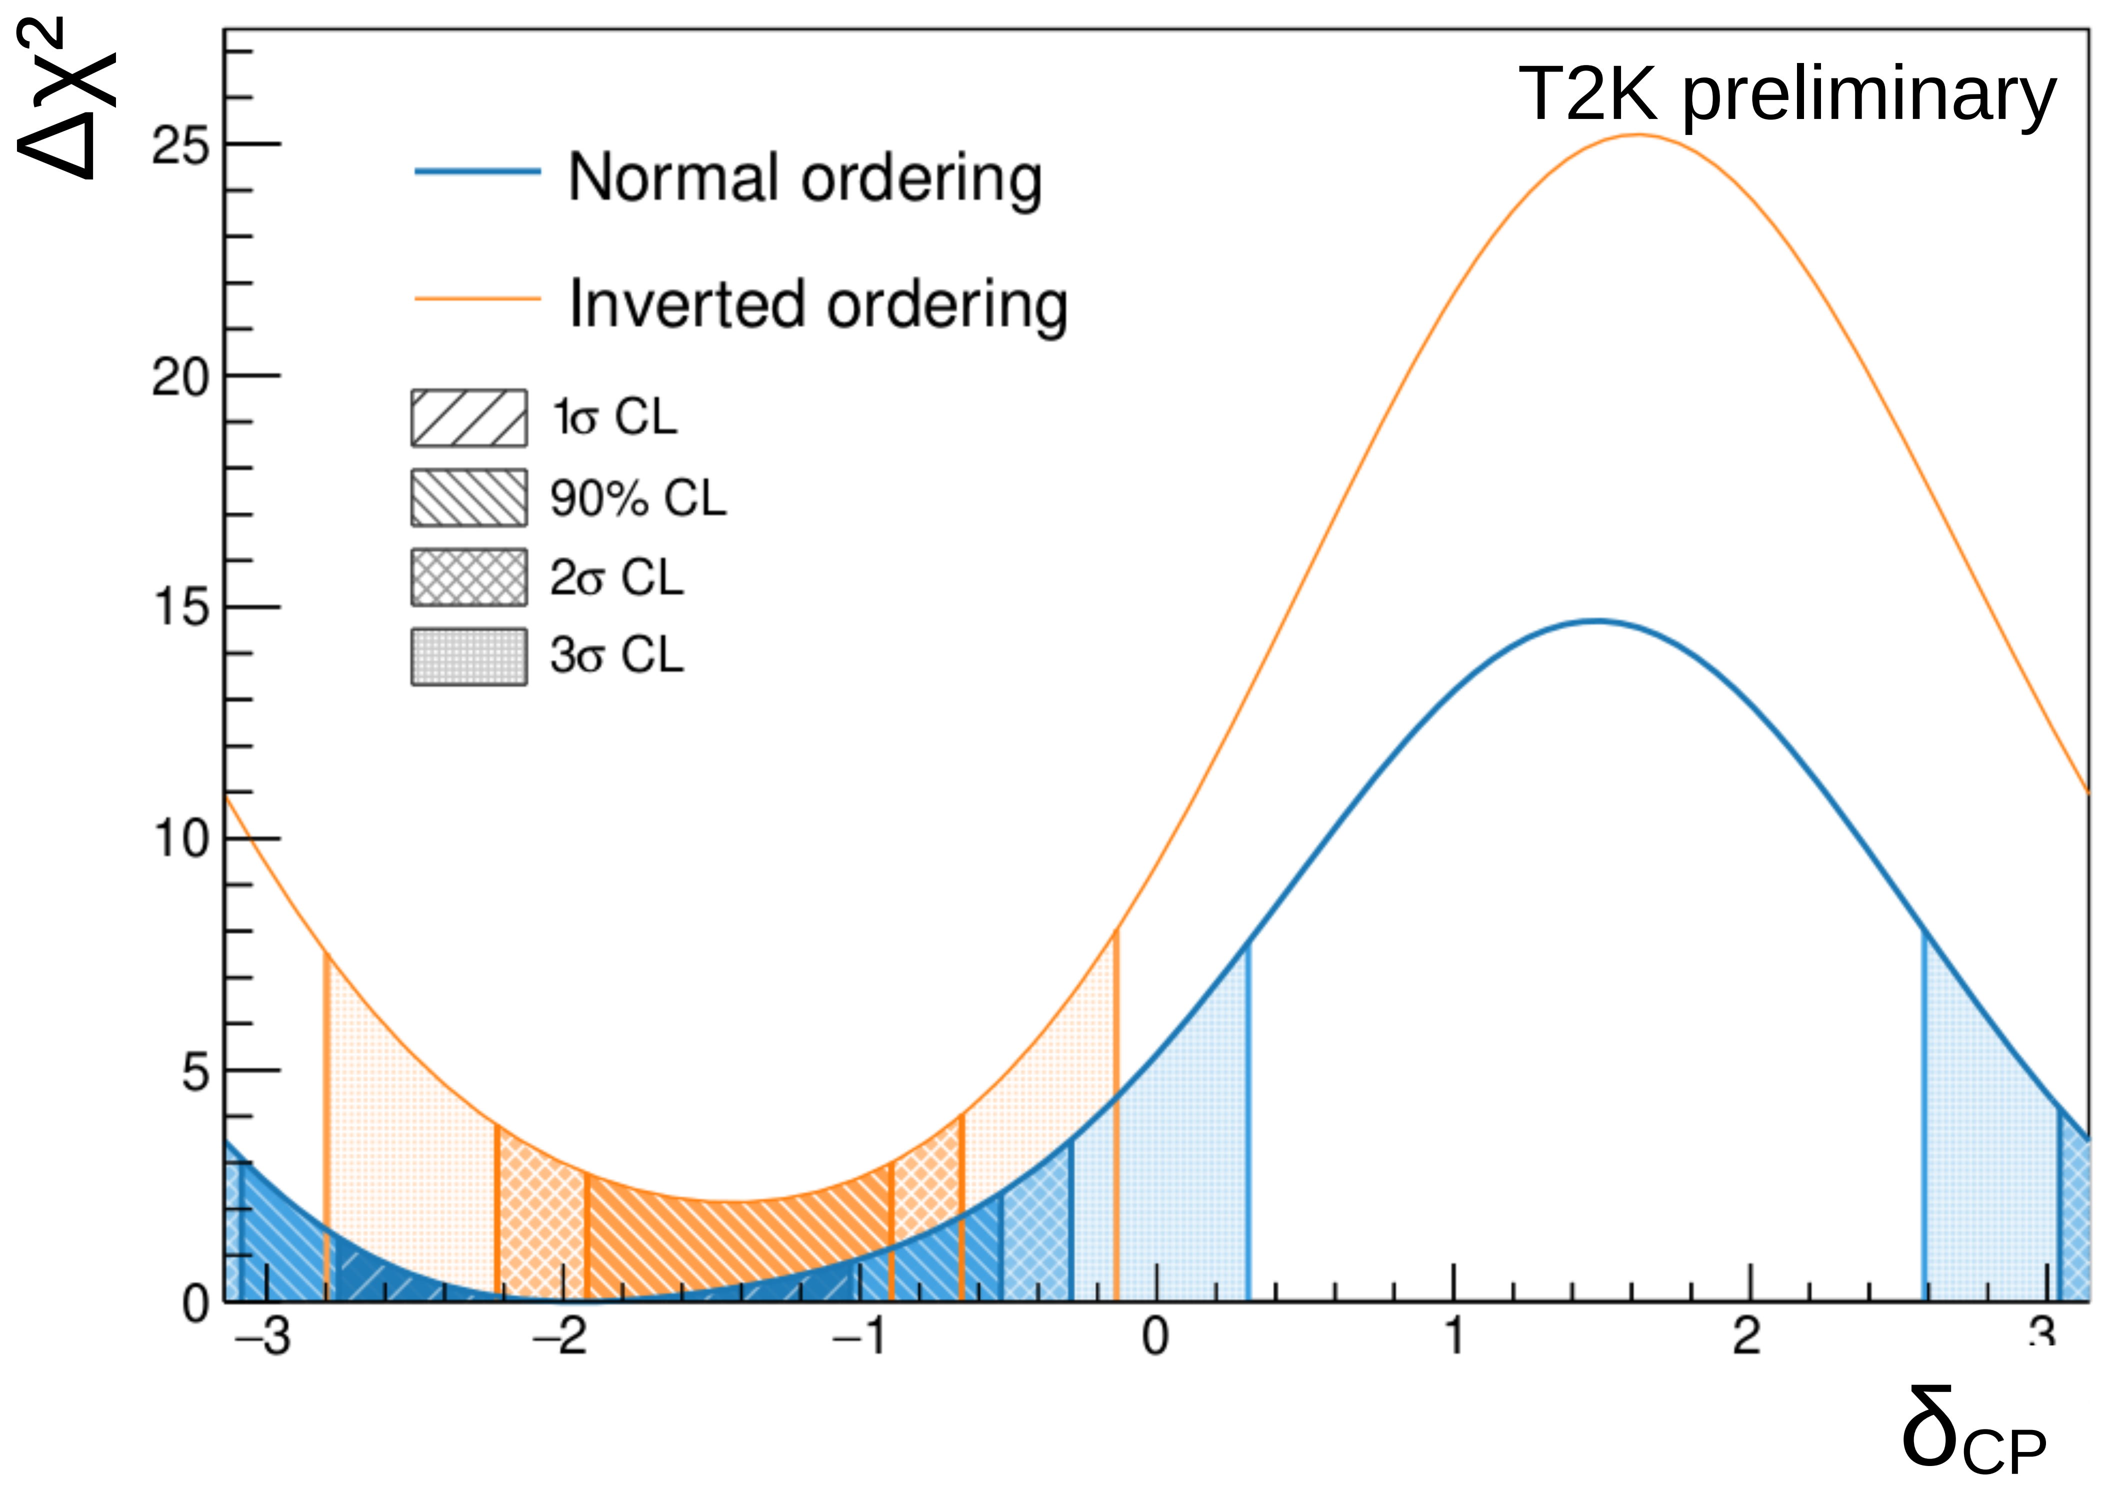


T2K

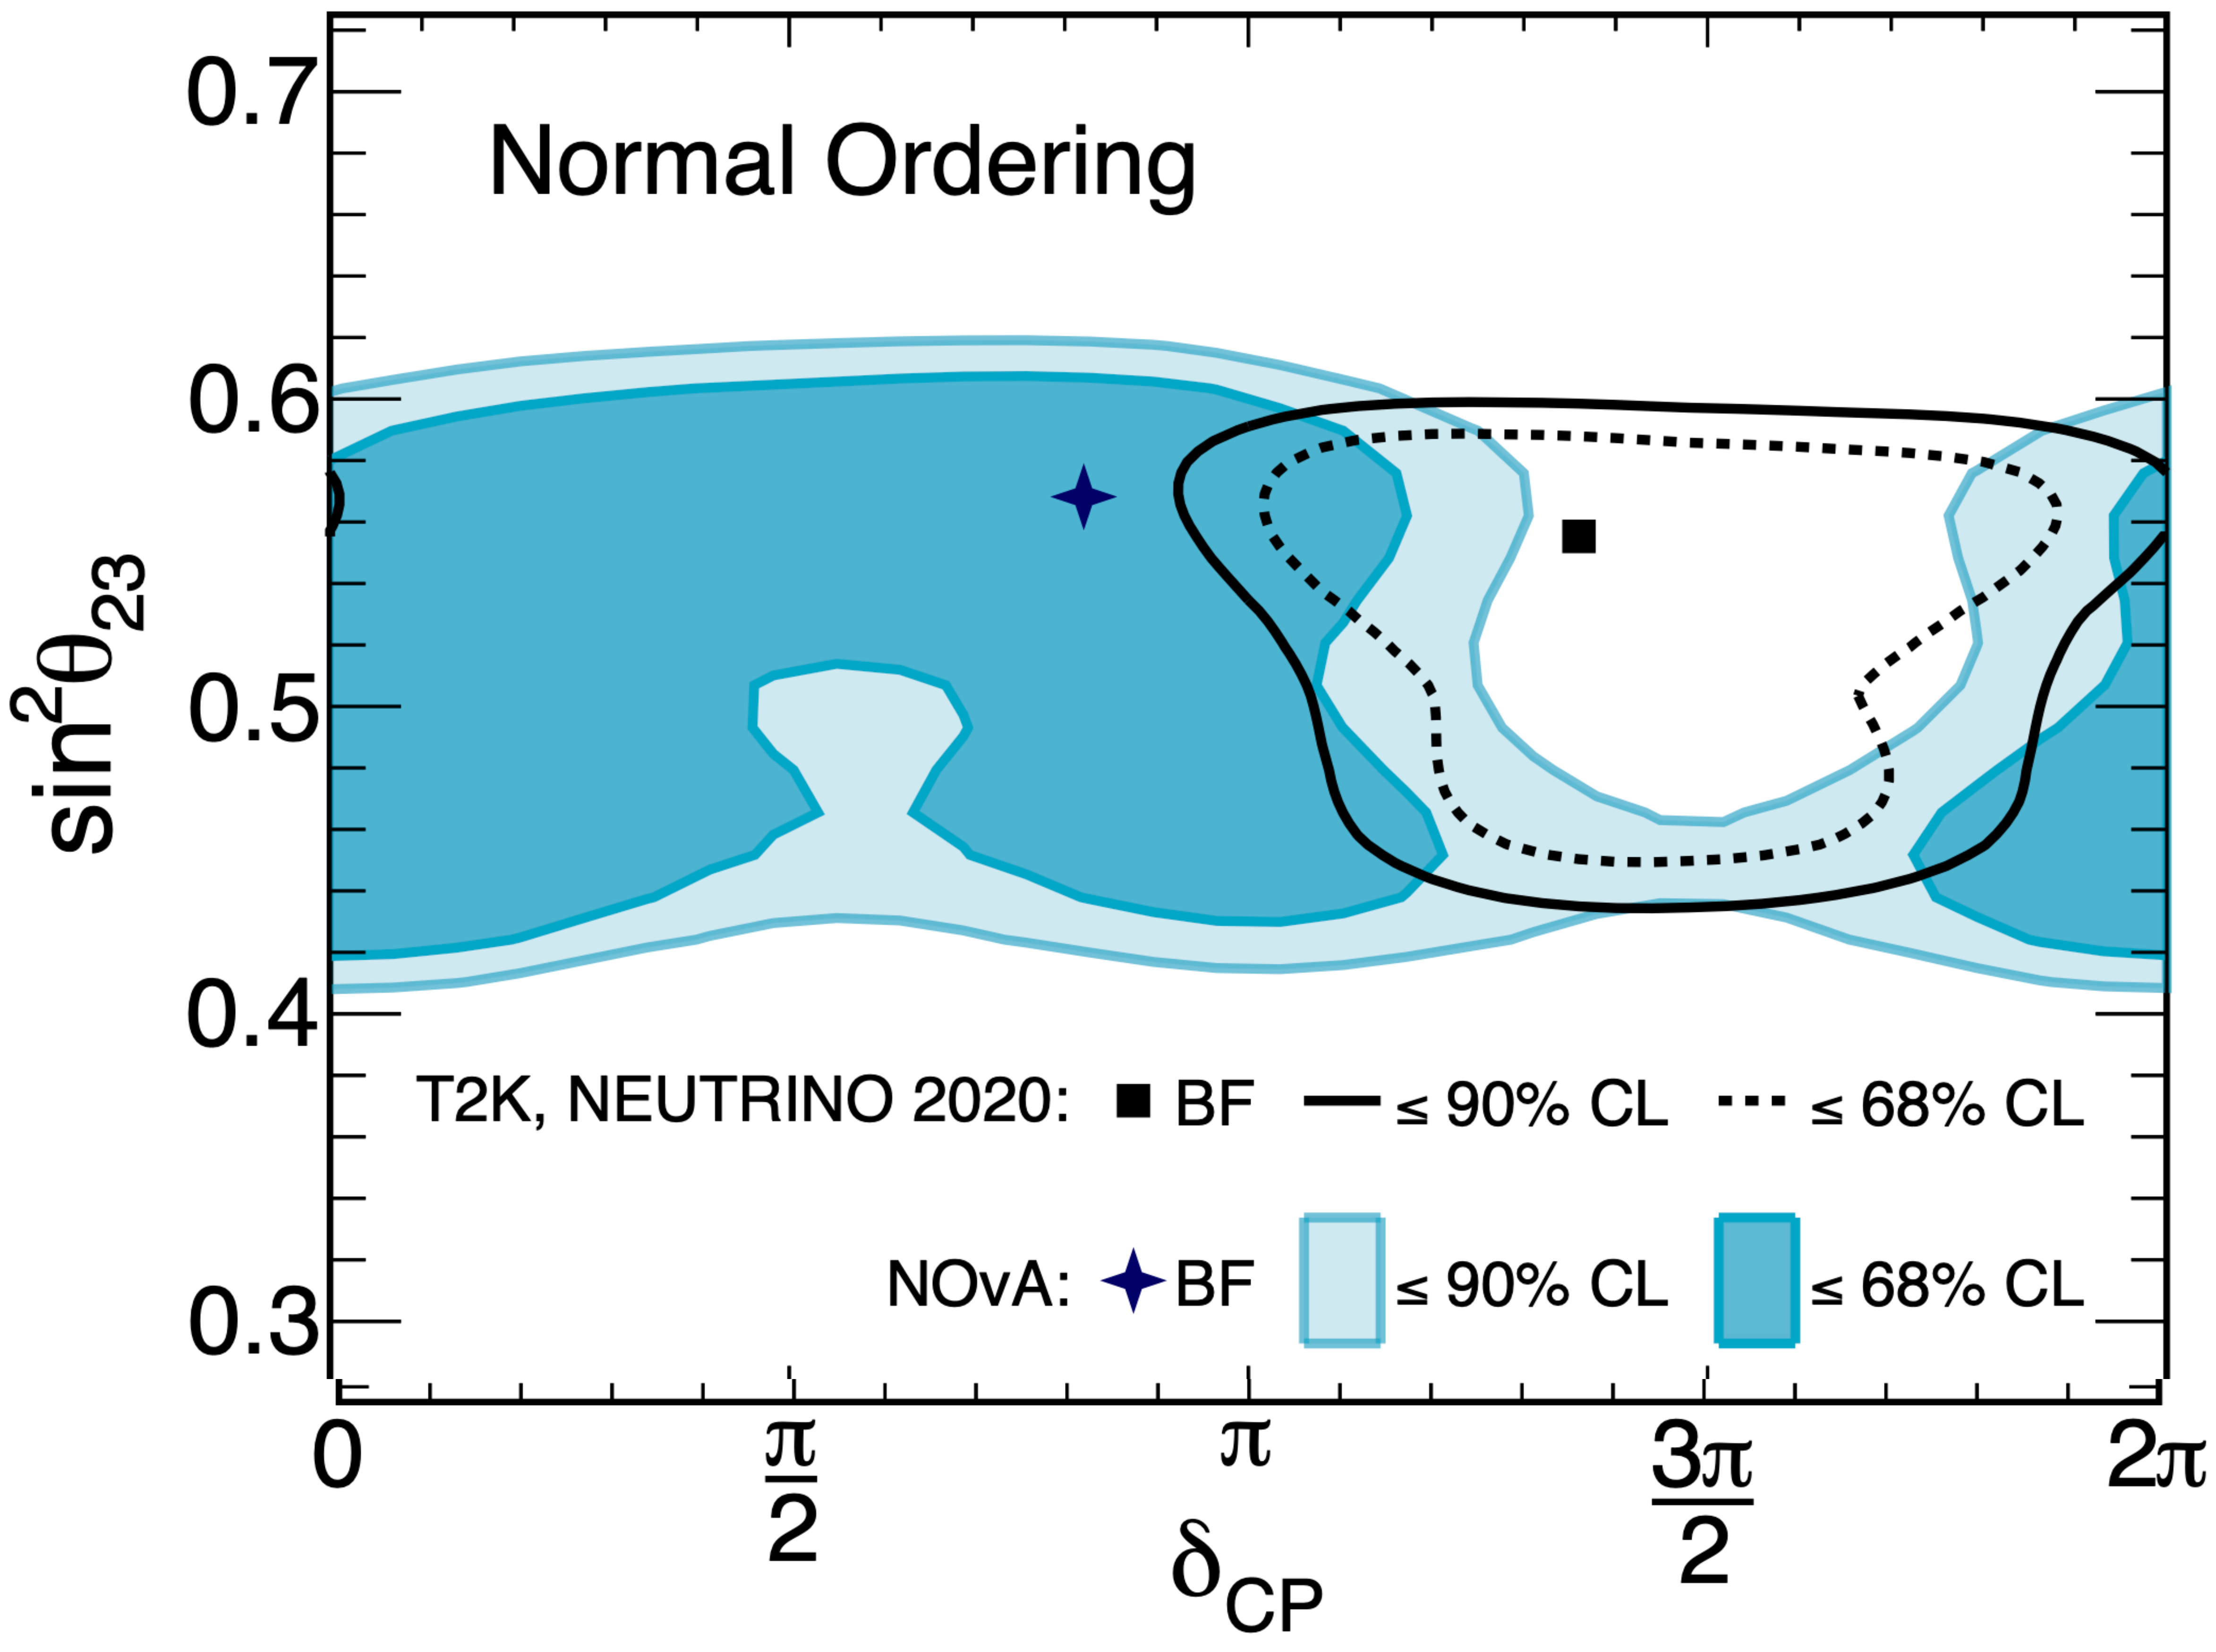
NoVA

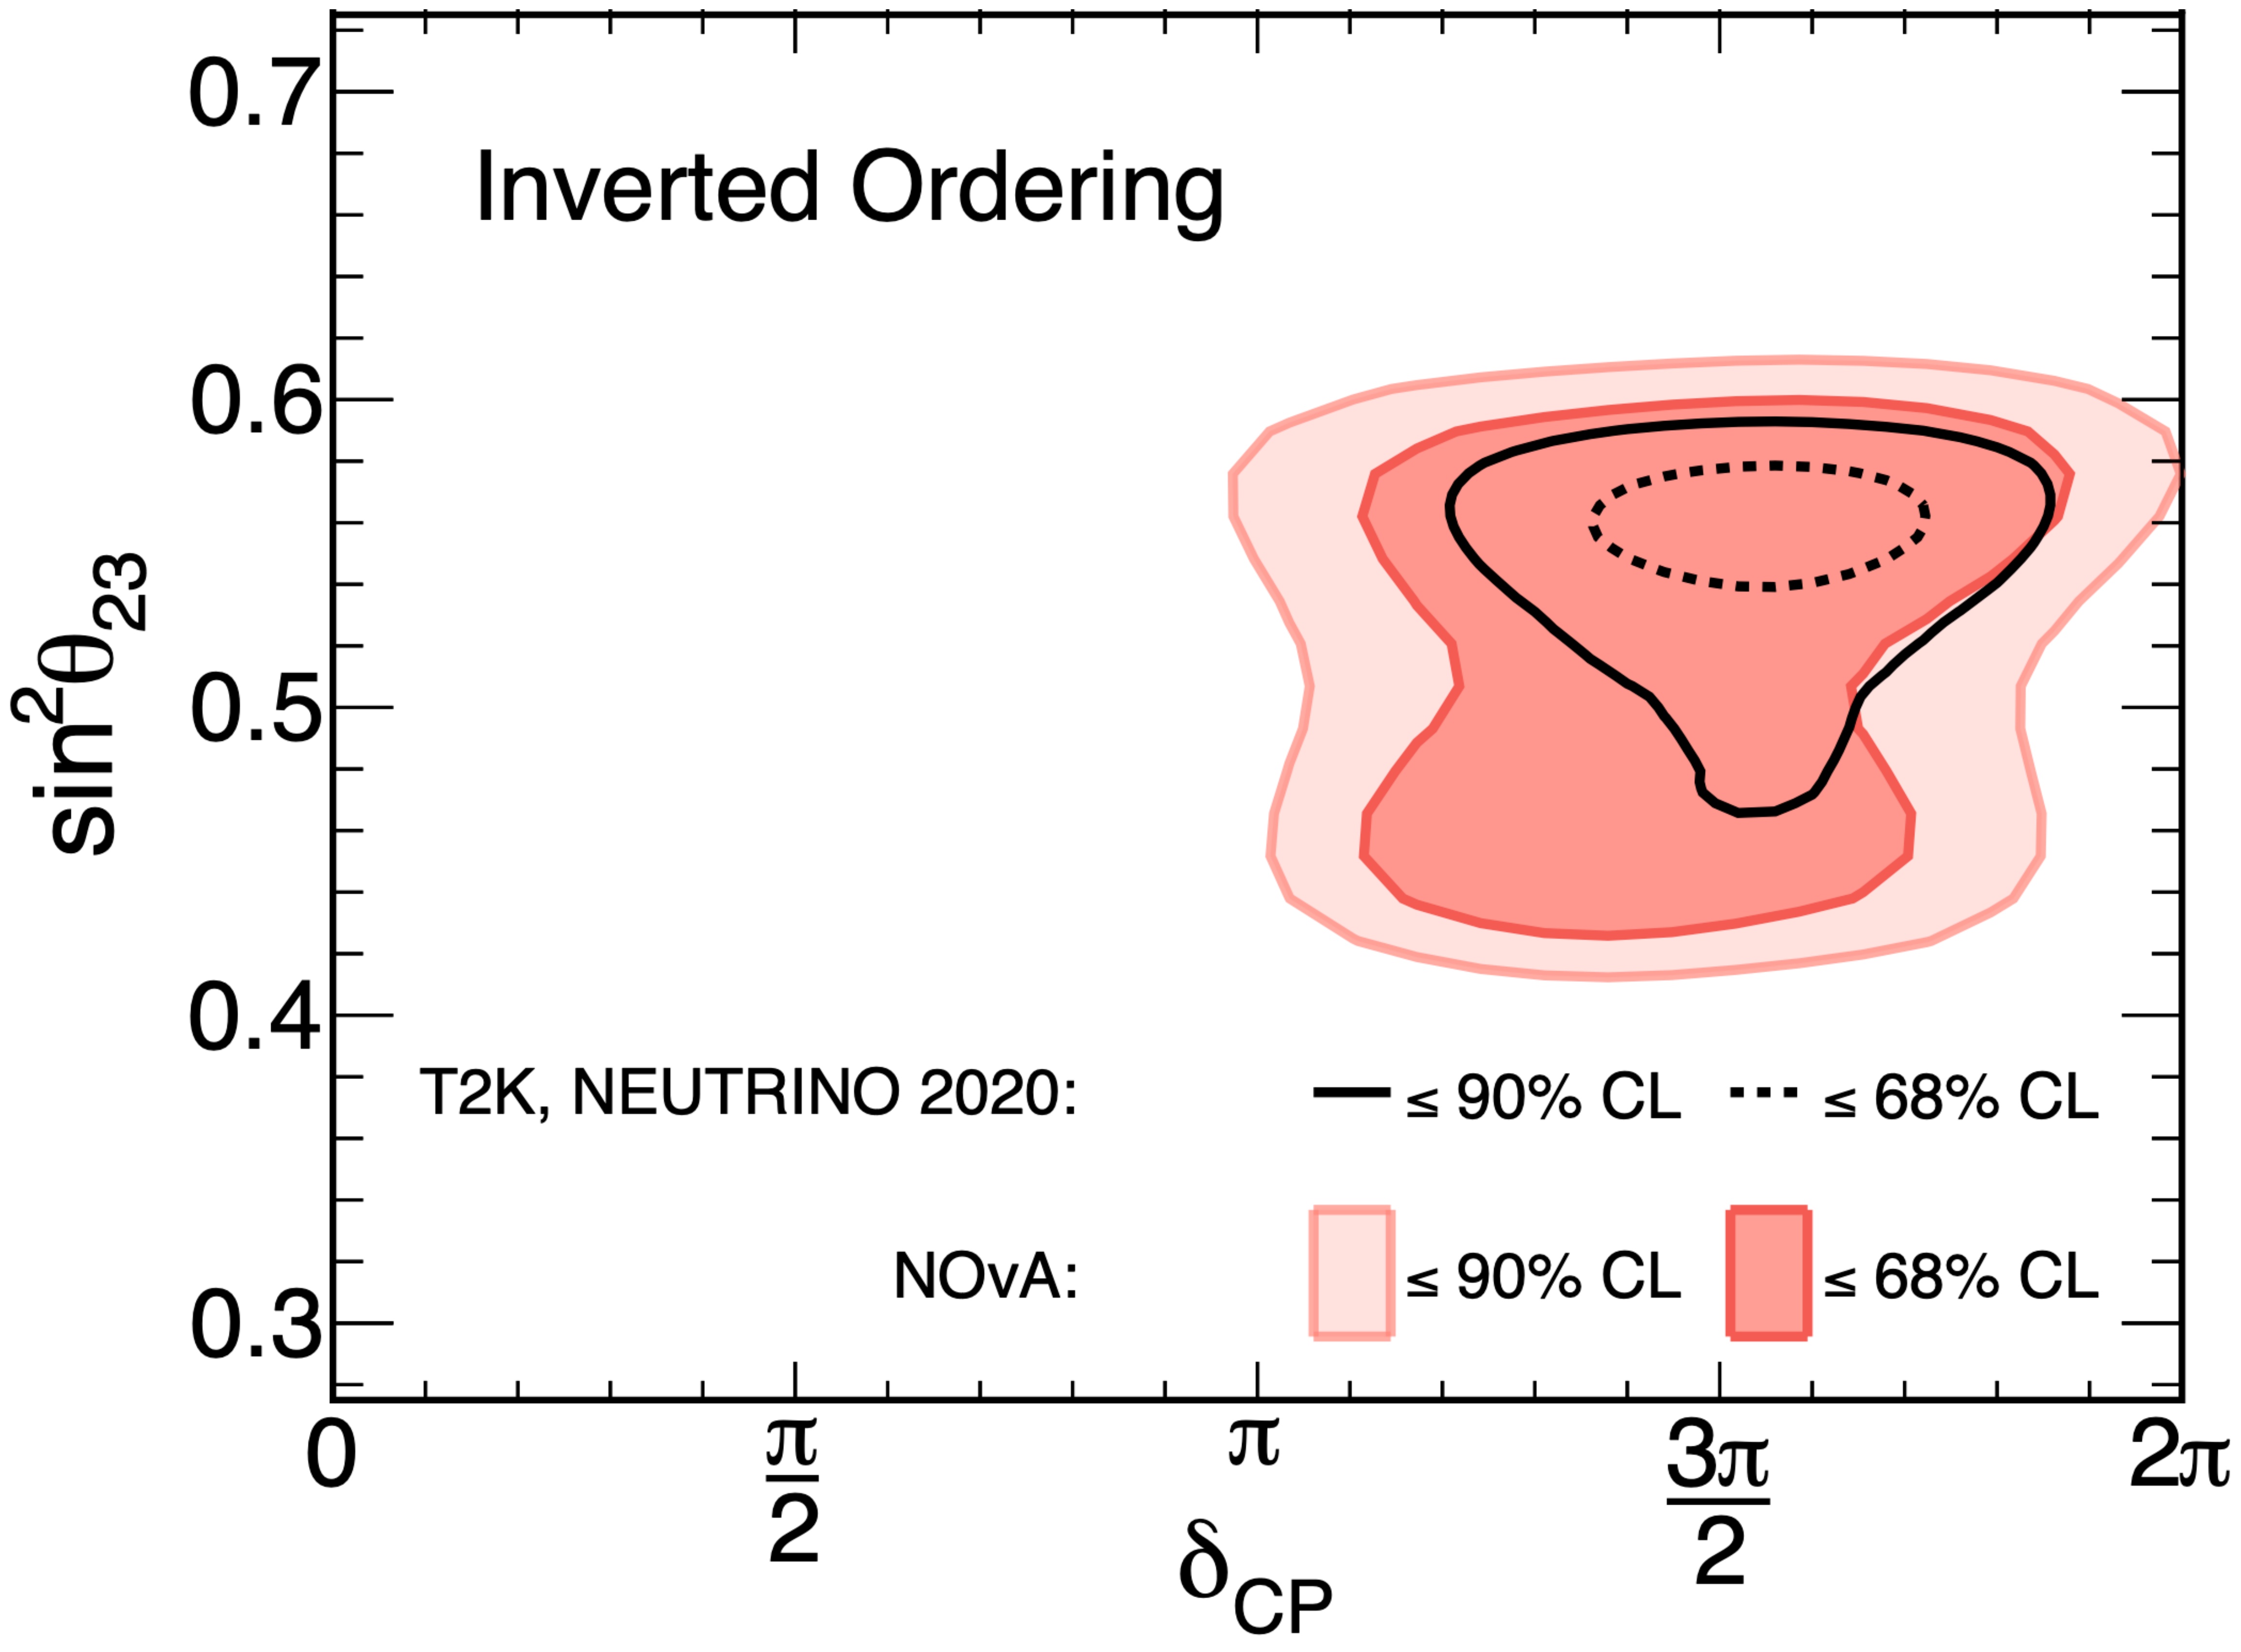
- T2K mild preference $\theta_{23} > 45^{\circ}$ and normal ordering
- T2K disfavours CP-conservation at 90% CL

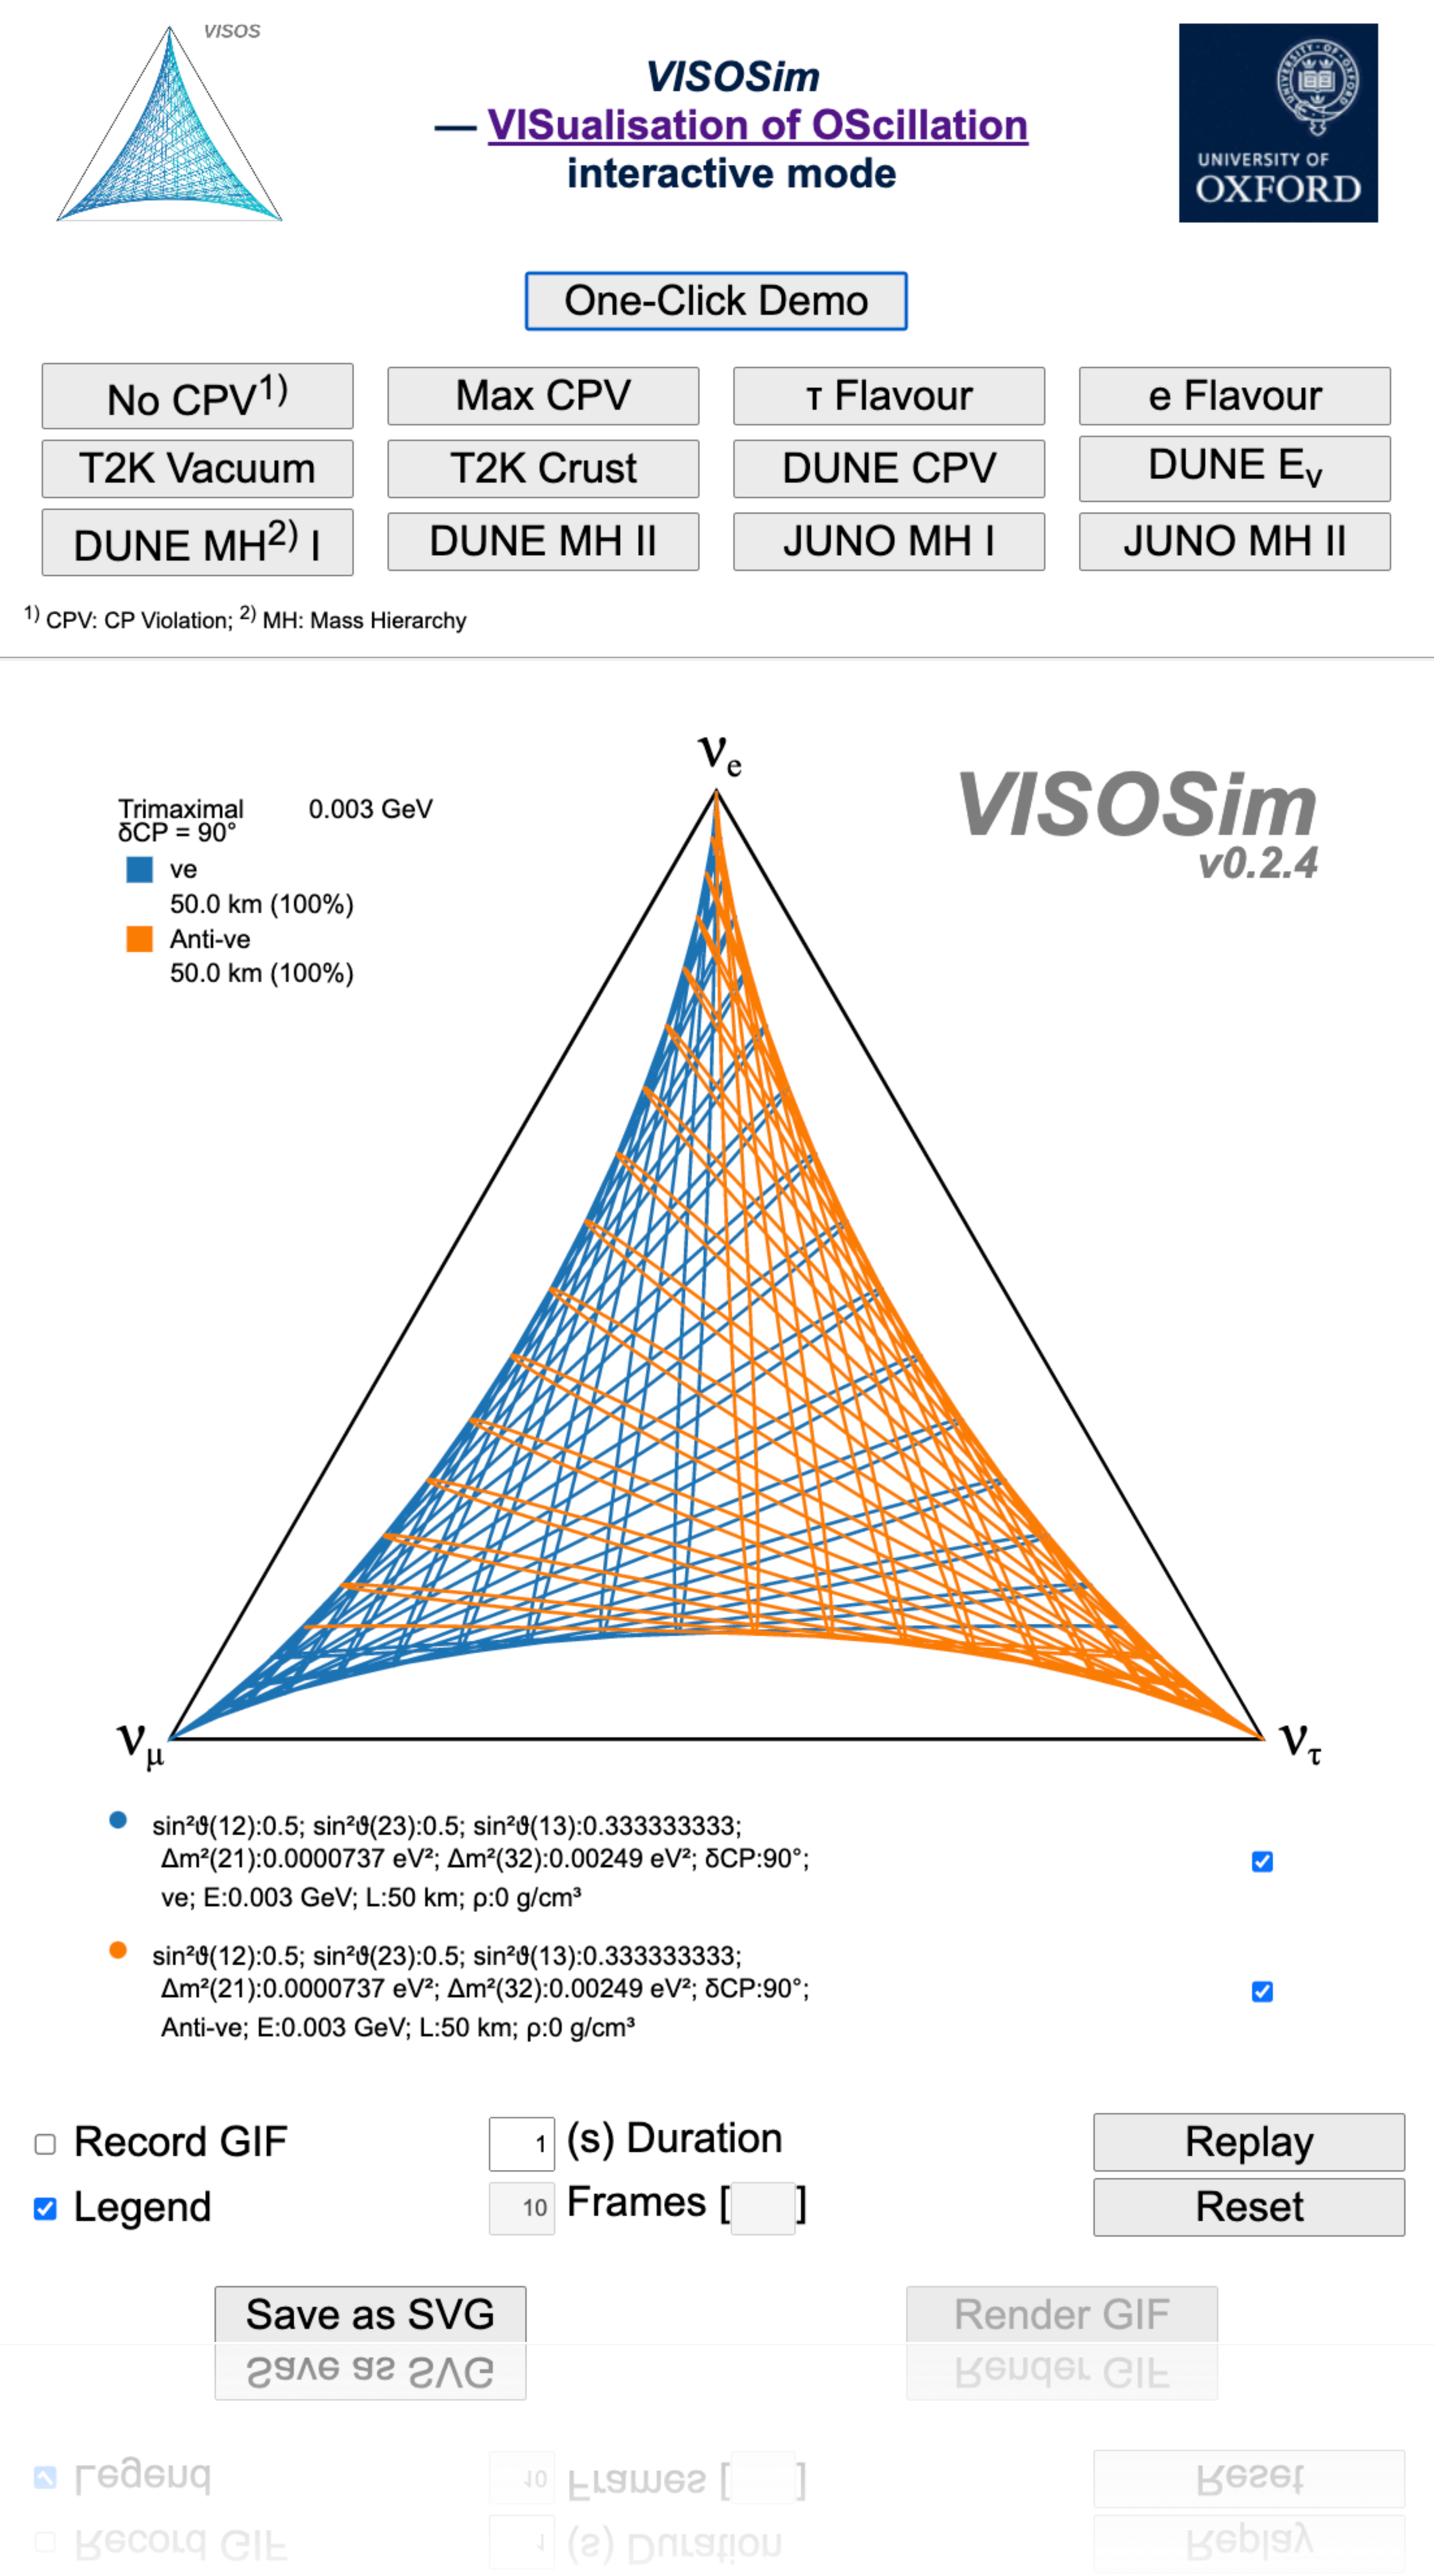




- NOVA has preference for normal ordering, $\delta \sim 145^\circ$
- Exclude IO and $\delta = \pi/2 \ > 3\sigma$







There are amazing neutrino Oscillation visualisation tools, check these out!

Neutrino Physics

Neutrino Oscillations in matter

Jessica Turner

Solar neutrinos - PP chain

- The Sun shines by making hydrogen → helium. There are two main ways of doing this: pp chain or CNO cycle

pp-chain I

Step 1 $p + p \rightarrow d + e^{+} + \nu_e$

Step 2 $p + d \rightarrow {}^{3}He + \gamma$

Step 3 repeat steps 1 & 2

Step 4 ${}^{3}He + {}^{3}He \rightarrow {}^{4}He + d + d$

Sun most loses its energy (98.5 %) through pp-chain. This is **pp-I chain** and occurs around **85% of the time**

Binding energy of deuterium

~ 2.2 MeV $\implies E_\nu < 0.5$ MeV

pp-neutrinos are hard to detect

Solar neutrinos - PP chain

- The Sun shines by making hydrogen into helium. There are two main ways of doing this: pp chain or CNO cycle

pp-chain II

Step 1 $\;{}^{4}He + {}^{3}He \rightarrow {}^{7}Be + \gamma$

pp-II chain occurs around **15%** of the time

Step 2 $\;{}^{7}Be + e^{-} \rightarrow {}^{7}Li + \nu_e$

Step 3 $\;{}^{7}Li + p \rightarrow 2\,{}^{4}He$

Solar neutrinos - PP chain

- The Sun shines by making hydrogen into helium. There are two main ways of doing this: pp chain or CNO cycle

pp-chain III

Step 1 $^{4}He + {}^{3}He \rightarrow {}^{7}Be + \gamma$

Step 2 $^{7}Be + p \rightarrow {}^{8}B + \gamma$

Step 3 $^{8}B \rightarrow {}^{8}Be^{*} + e^{+} + \nu_e$

$^{8}Be^{*} \rightarrow 2\,{}^{4}He$

pp-III chain occurs around **0.3%** of the time

Neutrinos produced in this reaction have energies up to 15 MeV

Solar neutrinos - CNO cycle

$$^{12}C + {}^{1}H \rightarrow {}^{13}N + \gamma$$

$$^{13}N \rightarrow {}^{13}C + e^{+} + \nu_e$$

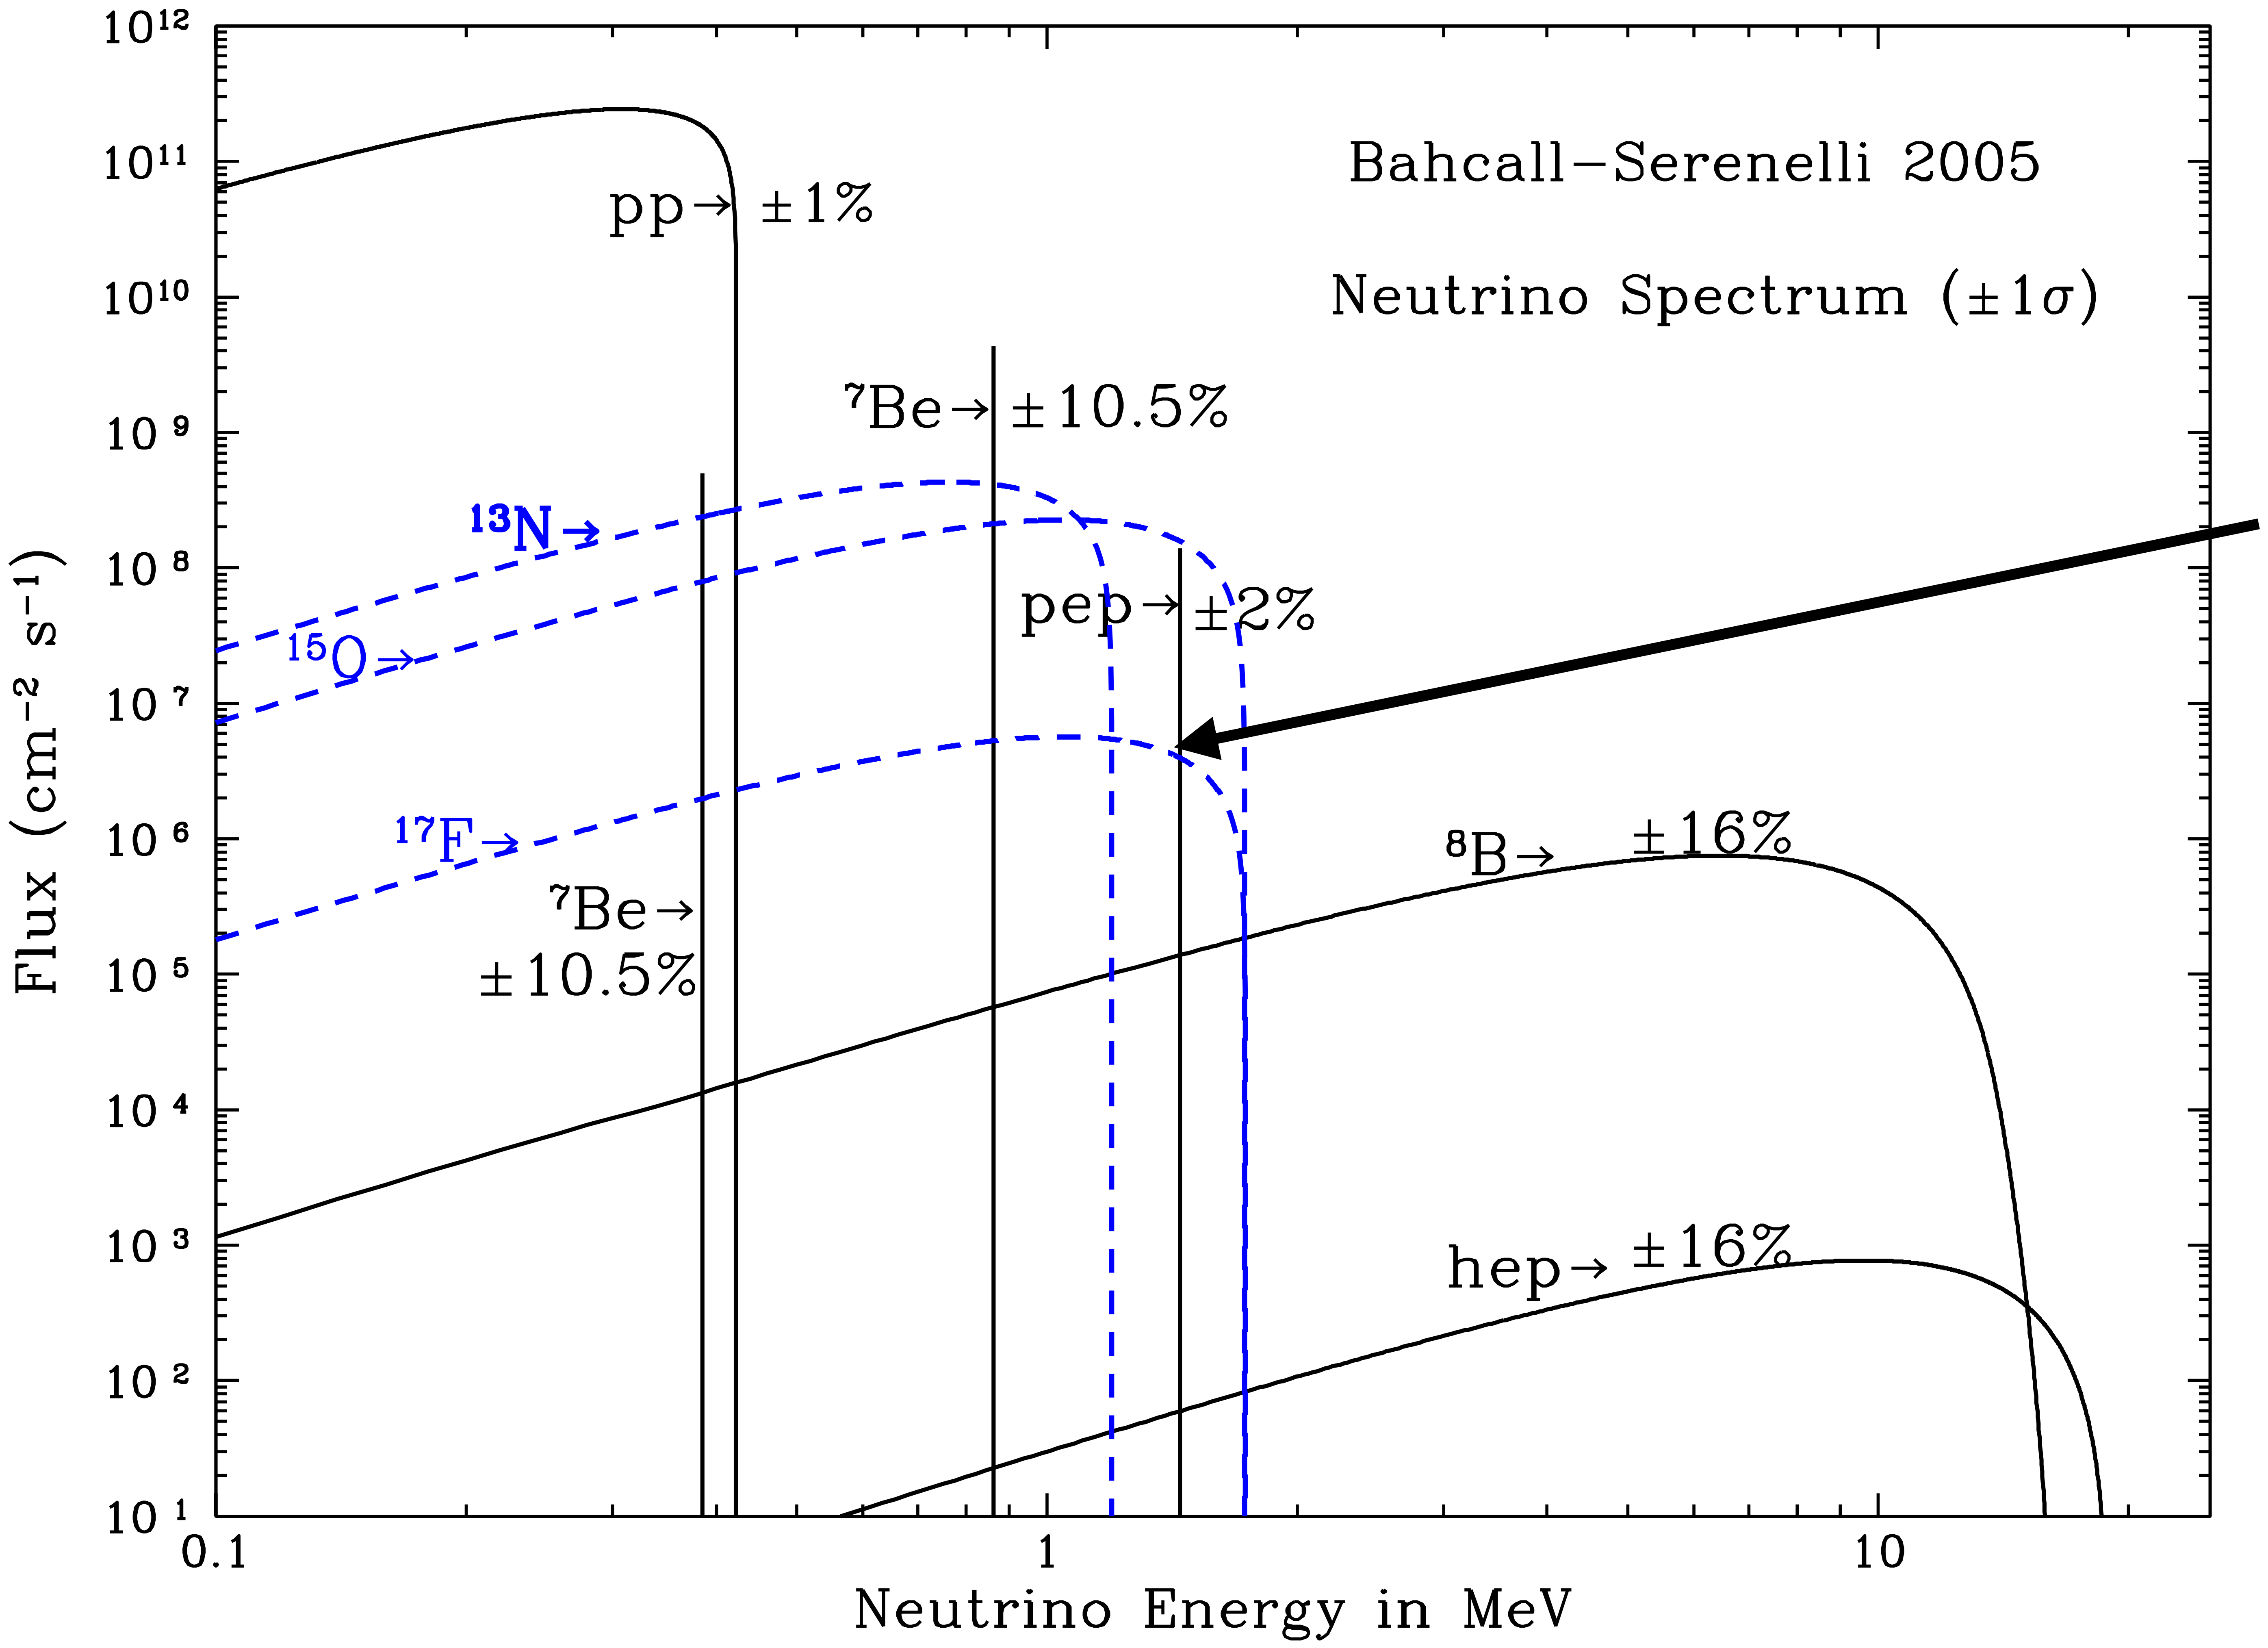
$$^{13}C + {}^{1}H \rightarrow {}^{14}N + \gamma$$

$$^{14}N + {}^{1}H \rightarrow {}^{15}O + \gamma$$

$$^{15}O \rightarrow {}^{15}N + e^{+} + \nu_e$$

$$^{15}N + {}^{1}H \rightarrow {}^{12}C + {}^{4}He$$

- Many nuclear processes (pp chain and CNO cycle) produces electron neutrinos
- Energies of the neutrinos will differ, depending on the reaction.



$$p + p + e^{-} \rightarrow D + \nu_e$$

Occurs $\sim 1\,\%$ of the time

Subdominant to pp-I since getting 3 particles in one place at one time is PS suppressed

Solar neutrinos

- 1964 Homestake experiment (headed by Davis & Bahcall) detected solar neutrinos but there were approximately 2/3 less than expected from Bahcall's Standard Solar Model prediction.

- It was initially proposed that the solar models were wrong.

- Or that two experiment Homestake and GALLEX were wrong!

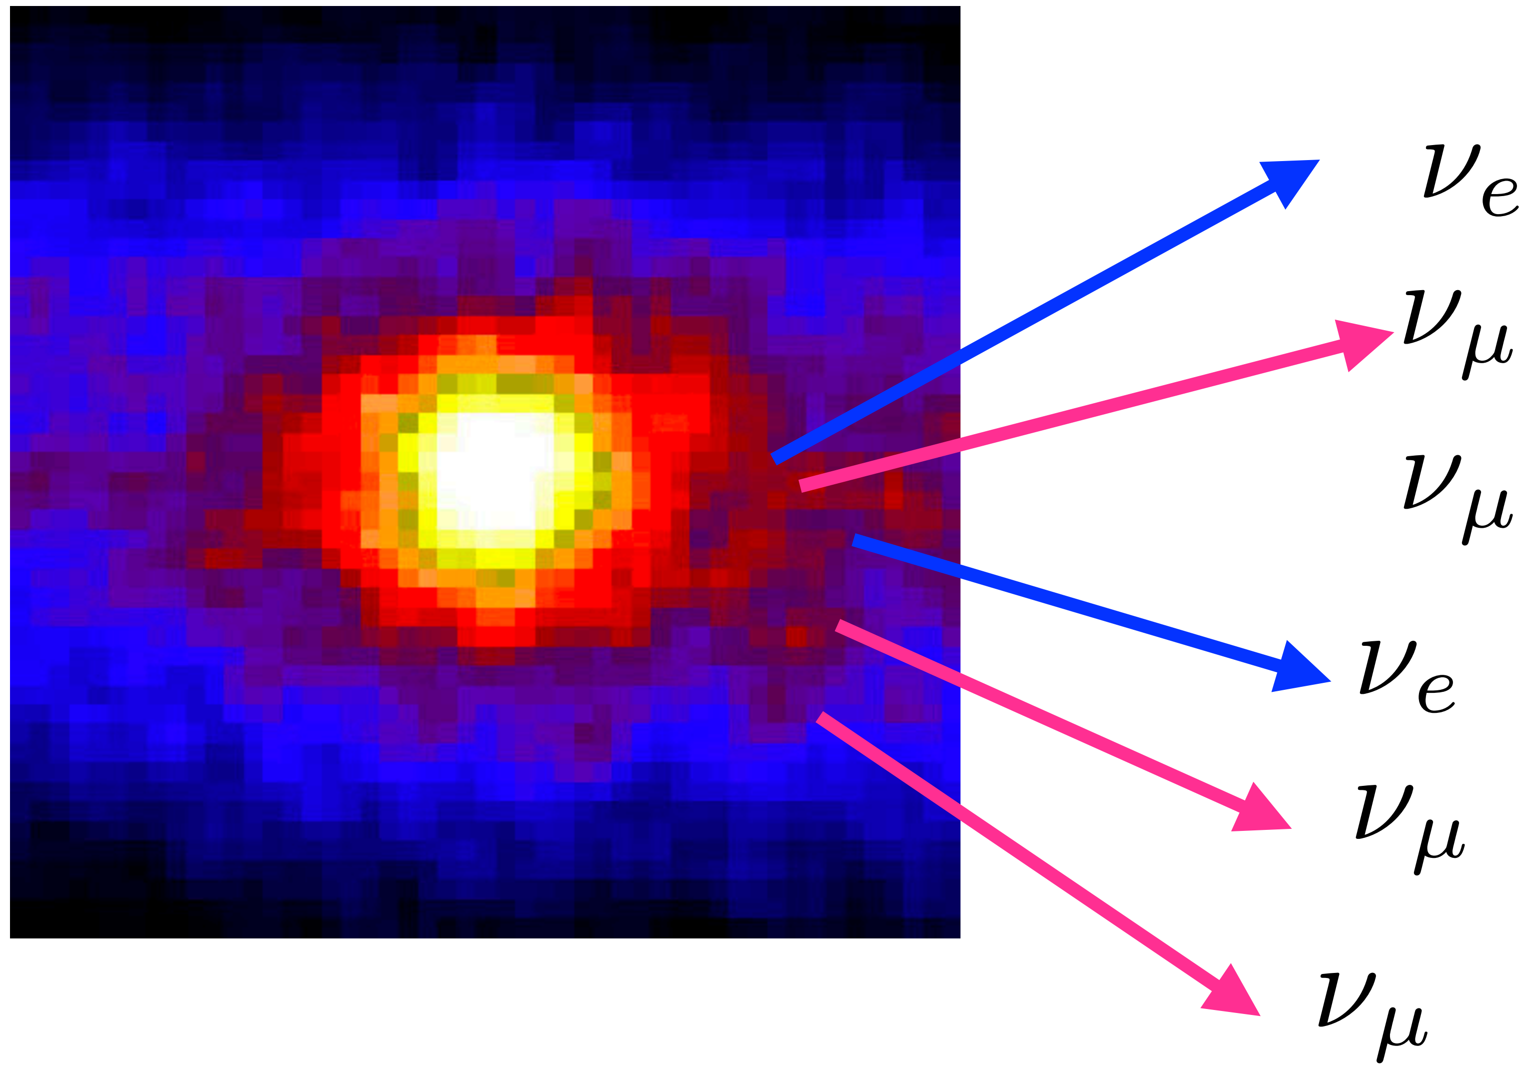
- As you can guess, the resolution to this problem is neither!

Board

Solar neutrinos

- Confirmation of neutrino oscillations came in 2001 by the Sudbury Neutrino. They measured not only electron neutrino flux but all flavour neutrinos via NC interactions

.



SNO 1 ton heavy water (D_2O) tank surrounded by 9600 PMTs. Deuterium has binding energy 2.2 MeV $\Longrightarrow$SNO can detect Boron 8 solar neutrinos.

$\nu_e + d \rightarrow p + p + e^-$	Charged current (CC)
$\nu_x + d \rightarrow p + n + \nu_x$	Neutral current (NC)
$\nu_x + e^- \rightarrow \nu_x + e^-$	Elastic scattering (ES)
