

Hadronic molecules in the single and double charm sector

Wednesday, 3 July 2024 11:40 (30 minutes)

After a brief introduction to the concept of hadronic molecules I will explain which kinds of observables are sensitive to a molecular component and which are not. The ideas will then be applied to properties of the $X(3872)$, data for the $Y(4230)$ and finally to the lowest lying positive parity open charm mesons.
