

Truly confining supersymmetric gauge theory

Shota Saito

Collaboration with Hitoshi Murayama and Riku Ishikawa

PASCOS 2025

Outline

► Motivation

Confinement can be understood as dual Meissner effect.

We want to understand more deeply about confinement!

- We studied toy model using technology of susy.
- we obtained some non-perturbative results.

Today's contents

- ▶ What is SUSY?
- ▶ What is QCD and its phase?
- ▶ SUSY QCD with non-trivial center symmetry

What is SUSY?

Bosonic symmetry

- Poincare symmetry + fermionic symmetry

$$Q|boson\rangle = |fermion\rangle$$

$$Q|fermion\rangle = |boson\rangle$$

- Theory has same number of boson and fermion state

squark, slepton, gaugino, Higgsino ...

What is advantages of SUSY?

- Holomorphy of superpotential: W

$$\mathcal{L} \supset \int d^2\theta W_{eff}(\Phi, \Lambda, g)$$

$$\frac{\partial W_{eff}}{\partial \Phi} = \frac{\partial W_{eff}}{\partial \bar{\Lambda}} = \frac{\partial W_{eff}}{\partial \bar{g}} = 0$$

Ex) non-renormalization theorem

Ex) ADS potential

$$W_{eff} = W_{tree} + W_{NP}$$

ADS potential

$$W_{NP} \propto \left(\frac{\Lambda^{3N}}{\det M} \right)^{\frac{1}{N-F}}$$

Today's contents

- ▶ What is SUSY?
- ▶ What is QCD and its phase?
- ▶ SUSY QCD with non-trivial center symmetry

What is QCD?

- Yang-Mills theory with matters

$$\mathcal{L}_{\text{QCD}} = \sum_{\psi} \left(i\bar{\psi}^j \gamma^{\mu} (\mathcal{D}_{\mu} \psi)_j - m_{\psi} \bar{\psi}^j \psi_j \right) - \frac{1}{4} G_{\mu\nu}^a G^{a\mu\nu}$$

- Describing hadron physics

proton

neutron

Phase of QCD

- ▶ Coulomb phase: $V(R) \sim 1/R$
- ▶ Free electric phase: $V(R) \sim 1/R \log(R)$
- ▶ Free magnetic phase: $V(R) \sim \log(R)/R$
- ▶ Higgs phase: $V(R) \sim \text{const.}$
- ▶ Confinement phase: $V(R) \sim R$

} Condensation of charge

Meissner effect

- ▶ Condensate **electric** charge
- ▶ Screening of electromagnetic field
- ▶ **Magnetic** flux is allowed

What about electromagnetic dual?

Magnetic flux

Dual Meissner effect

- ▶ Condensate **magnetic** charge
- ▶ Screening of electromagnetic field
- ▶ **Electric** flux is allowed

Explain confinement!

Electric flux

Electric flux between quarks

Electromagnetic duality

Coulomb phase $\leftrightarrow$ Coulomb phase

Free electric phase $\leftrightarrow$ Free magnetic phase

Confinement phase $\leftrightarrow$ Higgs phase

Dual Meissner effect

Superconductor (Meissner effect)

Today's contents

- ▶ What is SUSY?
- ▶ What is QCD and its phase?
- ▶ SUSY QCD with non-trivial center symmetry

What is center?

- Some elements in a group

which commute with all elements in the group

Ex) consider $SU(N)$ Lie group

Center is $\mathbb{Z}_N$ (group of N -th root of one)

$$\omega_N g - g \omega_N = 0, \quad g \in SU(N)$$

Screening

- Electric flux can be screened

when there exist appropriate dynamical charge.

Wilson loop

- ▶ Wilson loop sit on rep. R

$$W_R = \text{Tr}_R(P e^{\int A}) \longrightarrow \text{Weight lattice } \Lambda_w$$

- ▶ Gluon is on adjoint rep.

$$\text{then, screen the loops on adjoint rep.} \longrightarrow \text{Root lattice } \Lambda_r$$

- ▶ $V(R) \sim R$
unscreened loop (confinement phase) $\rightarrow \Lambda_w / \Lambda_r = \text{center}$

Non-trivial center symmetry

- MODEL : $SU(2k)$ + an antisymmetric quark

$$\int d^4\theta \{ \text{tr}(A(e^V)^\top A^\dagger e^V) + \text{tr}(\tilde{A}e^{-V} \tilde{A}^\dagger (e^{-V})^\top) \}$$

This theory confines with unscreened Wilson loop.

Non-trivial center symmetry

- We obtain ADS superpotential

$$W_{ADS} = \sum_i \varepsilon_i \left(\frac{\Lambda^{4k+2}}{\prod_{j \neq i} (a_i \tilde{a}_i - a_j \tilde{a}_j)^2} \right)^{\frac{1}{2}}$$

- We finished some consistency check.

symmetry/ holomorphy/ Higgs mechanism/
discrete anomaly matching conditions/ ...

- We showed **condensation of magnetic object.**

Other models

► We listed all confining theories with unscreened loops.

1. pure Yang-Mills
2. $SU(6)$ +an rank 3 antisymmetric tensor
3. $Sp(2k)$ +an antisymmetric tensor
4. $SO(k)$ +($k-3$) vectors
5. $SO(k)$ +($k-4$) vectors
6. $Spin(12)$ +two spinors

► All theories have condensation of magnetic objects.

Today's summary

- ▶ What is SUSY and advantage of SUSY?
- ▶ What is QCD, phases and electromagnetic duality?
- ▶ What is center, Wilson loop and screening?
- ▶ We showed that confining theories with unscreened loops have condensing magnetic objects.
