Two actions for one tachyon (in Minkowski)

Two actions for one tachyon (in Minkowski)

DBI tachyon (negligible higher-than-first-order derivatives):

$$\bar{\mathcal{S}}_T = - \int d^D x V(T) \sqrt{1 + \partial_\mu T \partial^\mu T}$$

Two actions for one tachyon (in Minkowski)

DBI tachyon (negligible higher-than-first-order derivatives):

$$\bar{\mathcal{S}}_T = - \int d^D x V(T) \sqrt{1 + \partial_\mu T \partial^\mu T}$$

Cubic string field theory:

$$\mathcal{S} = -\frac{1}{g_o^2} \int \left(\frac{1}{2\alpha'} \Phi * Q_B \Phi + \frac{1}{3} \Phi * \Phi * \Phi \right)$$

Two actions for one tachyon (in Minkowski)

DBI tachyon (negligible higher-than-first-order derivatives):

$$\bar{\mathcal{S}}_T = - \int d^D x V(T) \sqrt{1 + \partial_\mu T \partial^\mu T}$$

Cubic string field theory:

$$\mathcal{S} = -\frac{1}{g_o^2} \int \left(\frac{1}{2\alpha'} \Phi * Q_B \Phi + \frac{1}{3} \Phi * \Phi * \Phi \right)$$

At level $(0, 0)$: $\Phi \cong |\Phi\rangle = \phi(x) |\downarrow\rangle$ and (metric $- + + + \dots$)

Two actions for one tachyon (in Minkowski)

DBI tachyon (negligible higher-than-first-order derivatives):

$$\bar{S}_T = - \int d^D x V(T) \sqrt{1 + \partial_\mu T \partial^\mu T}$$

Cubic string field theory:

$$\mathcal{S} = -\frac{1}{g_o^2} \int \left(\frac{1}{2\alpha'} \Phi * Q_B \Phi + \frac{1}{3} \Phi * \Phi * \Phi \right)$$

At level (0, 0): $\Phi \cong |\Phi\rangle = \phi(x)|\downarrow\rangle$ and (metric $- + + + \dots$)

$$\bar{S}_\phi = \frac{1}{g_o^2} \int d^D x \left[\frac{1}{2\alpha'} \phi(\alpha' \partial_\mu \partial^\mu + 1) \phi - \frac{\lambda}{3} \left(\lambda^{\alpha' \partial_\mu \partial^\mu / 3} \phi \right)^3 - \Lambda \right]$$

where $\lambda = 3^{9/2}/2^6 \approx 2.19$.

Two actions for one tachyon (in Minkowski)

DBI tachyon (negligible higher-than-first-order derivatives):

$$\bar{S}_T = - \int d^D x V(T) \sqrt{1 + \partial_\mu T \partial^\mu T}$$

Cubic string field theory:

$$\mathcal{S} = -\frac{1}{g_o^2} \int \left(\frac{1}{2\alpha'} \Phi * Q_B \Phi + \frac{1}{3} \Phi * \Phi * \Phi \right)$$

At level $(0, 0)$: $\Phi \cong |\Phi\rangle = \phi(x)|\downarrow\rangle$ and (metric $- + + + \dots$)

$$\bar{S}_\phi = \frac{1}{g_o^2} \int d^D x \left[\frac{1}{2\alpha'} \phi(\alpha' \partial_\mu \partial^\mu + 1) \phi - \frac{\lambda}{3} \left(\lambda^{\alpha' \partial_\mu \partial^\mu / 3} \phi \right)^3 - \Lambda \right]$$

where $\lambda = 3^{9/2}/2^6 \approx 2.19$. Theories with an ∞ number of derivatives are called **nonlocal**.

- DBI tachyon (local): extensively studied both as inflaton and dark energy field but problematic or ineffective in both cases.
- The equation of state of CSFT tachyon is less rigid than the DBI one. A comparison would open up interesting possibilities. [▶ Skip details](#)

DBI tachyon inflation

DBI tachyon inflation

- No reheating with runaway string effective potentials.

DBI tachyon inflation

- No reheating with runaway string effective potentials.
- Large density perturbations with such potentials.

DBI tachyon inflation

- No reheating with runaway string effective potentials.
- Large density perturbations with such potentials.
- Reheating can be achieved with a negative KKLT-like Λ . Anisotropies adjusted with small warp factor [Garousi et al. 2004].

DBI tachyon inflation

- No reheating with runaway string effective potentials.
- Large density perturbations with such potentials.
- Reheating can be achieved with a negative KKLT-like Λ . Anisotropies adjusted with small warp factor [Garousi et al. 2004].
- With phenomenological potentials, good inflation and non-Gaussianity but non-characteristic predictions.

DBI tachyon as dark energy

with Andrew R. Liddle – PRD **74**, 043528 (2006), astro-ph/0606003

DBI tachyon as dark energy

with Andrew R. Liddle – PRD **74**, 043528 (2006), astro-ph/0606003

- Only phenomenological (string decay scale).

DBI tachyon as dark energy

with Andrew R. Liddle – PRD 74, 043528 (2006), astro-ph/0606003

- Only phenomenological (string decay scale).
- Different predictions between the DBI tachyon and canonical quintessence?

DBI tachyon as dark energy

with Andrew R. Liddle – PRD 74, 043528 (2006), astro-ph/0606003

- Only phenomenological (string decay scale).
- Different predictions between the DBI tachyon and canonical quintessence?
- For a wide choice of potentials (ad-hoc or motivated), fine tuning on either the i.c. or the parameters of the potential.

DBI tachyon as dark energy

with Andrew R. Liddle – PRD 74, 043528 (2006), astro-ph/0606003

- Only phenomenological (string decay scale).
- Different predictions between the DBI tachyon and canonical quintessence?
- For a wide choice of potentials (ad-hoc or motivated), fine tuning on either the i.c. or the parameters of the potential.
- High-precision observational cosmology allows to constrain the theory in a remarkable way.

DBI tachyon as dark energy

with Andrew R. Liddle – PRD 74, 043528 (2006), astro-ph/0606003

- Only phenomenological (string decay scale).
- Different predictions between the DBI tachyon and canonical quintessence?
- For a wide choice of potentials (ad-hoc or motivated), fine tuning on either the i.c. or the parameters of the potential.
- High-precision observational cosmology allows to constrain the theory in a remarkable way.
- The tachyon cannot decay faster than dust matter, $\rho_T \sim a^{-3(1+w_T)} > \rho_m \sim a^{-3} \Rightarrow$ cannot be used as quintessential inflaton.

An analytic recipe

We propose a systematic method which allows:

An analytic recipe

We propose a systematic method which allows:

1:

To construct **nonperturbative** solutions (at least approximate, hopefully exact) of general nonlocal systems on Minkowski and curved background. Perturbative solutions are automatically recovered.

An analytic recipe

We propose a systematic method which allows:

1:

To construct **nonperturbative** solutions (at least approximate, hopefully exact) of general nonlocal systems on Minkowski and curved background. Perturbative solutions are automatically recovered.

2:

To address all issues of nonlocality, including initial conditions problem and consistent quantization.

Constant SR parameters when $q = -1$.

$$\square^\ell \phi = (-1)^\ell t^{p-2\ell} \prod_{n=0}^{\ell-1} (p - 2n)(p - 2n - 1 + 3H_0).$$

If $p \in \mathbb{R} \setminus \mathbb{N}^+$, $\tilde{\phi}$ is ill-defined:

$$\lim_{\ell \rightarrow \infty} \left| \frac{c_{\ell+1} \square^{\ell+1} \phi}{c_\ell \square^\ell \phi} \right| = \lim_{\ell \rightarrow \infty} |c_1 (p - 2\ell)(p - 2\ell - 1 + 3H_0)| \frac{t^{-2}}{\ell + 1} = +\infty.$$

Unviable cosmologies?

Important class of dynamics:

$$\phi = t^p, \quad H = H_0 t^q$$

Constant SR parameters when $q = -1$.

$$\square^\ell \phi = (-1)^\ell t^{p-2\ell} \prod_{n=0}^{\ell-1} (p-2n)(p-2n-1+3H_0).$$

If $p \in \mathbb{R} \setminus \mathbb{N}^+$, $\tilde{\phi}$ is ill-defined:

$$\lim_{\ell \rightarrow \infty} \left| \frac{c_{\ell+1} \square^{\ell+1} \phi}{c_\ell \square^\ell \phi} \right| = \lim_{\ell \rightarrow \infty} |c_1 (p-2\ell)(p-2\ell-1+3H_0)| \frac{t^{-2}}{\ell+1} = +\infty.$$

Finite series if p is a positive even number (then $\tilde{\phi} \sim t^p$) or $p-1+3H_0 = 2n$.

Unviable cosmologies?

Can we conclude that power-law cosmology cannot be used as a base for nonlocal solutions?

Unviable cosmologies?

Can we conclude that power-law cosmology cannot be used as a base for nonlocal solutions?

NO!

What is not defined is the nonlocal solution expressed as an infinite series of powers of the d'Alembertian.

Localization

G.C., M. Montobbio, G. Nardelli, 0705.3043 [hep-th]

- Interpret r_* as a fixed value of an auxiliary evolution variable r .

Localization

G.C., M. Montobbio, G. Nardelli, 0705.3043 [hep-th]

- Interpret r_* as a fixed value of an auxiliary evolution variable r . The scalar field $\phi(r, t)$ is thought to live in $1 + 1$ dimensions.

Localization

G.C., M. Montobbio, G. Nardelli, 0705.3043 [hep-th]

- Interpret r_* as a fixed value of an auxiliary evolution variable r . The scalar field $\phi(r, t)$ is thought to live in $1 + 1$ dimensions.
- The solution $\phi_{\text{loc}}(t) = \phi(0, t)$ of the local system ($r_* = 0$) is the “initial condition”.

Localization

G.C., M. Montobbio, G. Nardelli, 0705.3043 [hep-th]

- Interpret r_* as a fixed value of an auxiliary evolution variable r . The scalar field $\phi(r, t)$ is thought to live in $1 + 1$ dimensions.
- The solution $\phi_{\text{loc}}(t) = \phi(0, t)$ of the local system ($r_* = 0$) is the “initial condition”.
- Define

$$\phi(r, t) \equiv e^{r(\beta + \square/\alpha)} \phi_{\text{loc}}(t)$$

Properties

- 1 It satisfies the diffusion equation:

$$\alpha \partial_r \phi(r, t) = \alpha \beta \phi(r, t) + \square \phi(r, t)$$

Properties

- 1 It satisfies the diffusion equation:

$$\alpha \partial_r \phi(r, t) = \alpha \beta \phi(r, t) + \square \phi(r, t)$$

- 2 $e^{q\square}$ is simply a shift of the auxiliary variable r .

$$e^{q\square} \phi(r, t) = e^{\alpha q \partial_r} \phi(r, t) = \phi(r + \alpha q, t)$$

Properties

- 1 It satisfies the diffusion equation:

$$\alpha \partial_r \phi(r, t) = \alpha \beta \phi(r, t) + \square \phi(r, t)$$

- 2 $e^{q\square}$ is simply a shift of the auxiliary variable r .

$$e^{q\square} \phi(r, t) = e^{\alpha q \partial_r} \phi(r, t) = \phi(r + \alpha q, t)$$

- 3 The system becomes local in t !

Properties

- 1 It satisfies the diffusion equation:

$$\alpha \partial_r \phi(r, t) = \alpha \beta \phi(r, t) + \square \phi(r, t)$$

- 2 $e^{q\square}$ is simply a shift of the auxiliary variable r .

$$e^{q\square} \phi(r, t) = e^{\alpha q \partial_r} \phi(r, t) = \phi(r + \alpha q, t)$$

- 3 The system becomes local in t !

$$(\square - m^2) \phi(r, t) = \tilde{U}'[\phi((1 + 2\alpha)r, t)]$$

Properties

- 1 It satisfies the diffusion equation:

$$\alpha \partial_r \phi(r, t) = \alpha \beta \phi(r, t) + \square \phi(r, t)$$

- 2 $e^{q\square}$ is simply a shift of the auxiliary variable r .

$$e^{q\square} \phi(r, t) = e^{\alpha q \partial_r} \phi(r, t) = \phi(r + \alpha q, t)$$

- 3 The system becomes local in t !

$$(\square - m^2) \phi(r, t) = \tilde{U}'[\phi((1 + 2\alpha)r, t)]$$

Valid for **general** nonlocal operators and 'diffusion equations'.

Steps towards localized solutions

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

$$\phi(0, t) = \int d\mu G(\mu, t) f(\mu).$$

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

$$\phi(0, t) = \int d\mu G(\mu, t) f(\mu).$$

- 3 Write the nonlocal function (**Gabor transform**):

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

$$\phi(0, t) = \int d\mu G(\mu, t) f(\mu).$$

- 3 Write the nonlocal function (**Gabor transform**):

$$\phi(r, t) = \int d\mu e^{r(\beta + \mu^2/\alpha)} G(\mu, t) f(\mu).$$

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

$$\phi(0, t) = \int d\mu G(\mu, t) f(\mu).$$

- 3 Write the nonlocal function (**Gabor transform**):

$$\phi(r, t) = \int d\mu e^{r(\beta + \mu^2/\alpha)} G(\mu, t) f(\mu).$$

It satisfies the heat equation by definition!

Steps towards localized solutions

- 1 Find the eigenstates of the d'Alembertian operator:

$$\square G(\mu, t) = -\ddot{G}(\mu, t) - 3H\dot{G}(\mu, t) = \mu^2 G(\mu, t).$$

- 2 Write the local solution as an expansion in the basis of eigenstates of the \square (**integral transform**):

$$\phi(0, t) = \int d\mu G(\mu, t) f(\mu).$$

- 3 Write the nonlocal function (**Gabor transform**):

$$\phi(r, t) = \int d\mu e^{r(\beta + \mu^2/\alpha)} G(\mu, t) f(\mu).$$

It satisfies the heat equation by definition!

- 4 Check that $\phi(r, t)$ is a solution of the nonlocal e.o.m.s for some α, β .

Outline

- 1 Motivations
 - Tachyon and tachyons
 - Three questions
 - The CSFT tachyon
 - Cosmology
 - Problems in constructing nonlocal solutions
- 2 Diffusion equation method
 - Localization
 - **Susy CSFT nonperturbative solutions on Minkowski**
 - 'Unviable' cosmologies revisited

G.C., G. Nardelli, arXiv:0708.0366 [hep-th]

G.C., G. Nardelli, arXiv:0708.0366 [hep-th]

Exact susy potential $U \propto (e^{r_* \square} \tilde{\phi}^2)^2$, Minkowski background ($R = 0$).

G.C., G. Nardelli, arXiv:0708.0366 [hep-th]

Exact susy potential $U \propto (e^{r_* \square} \tilde{\phi}^2)^2$, Minkowski background ($R = 0$).

$$\psi(r, t) = - \int_{-\infty}^{+\infty} d\sigma \partial_\sigma K(\sigma, r) \ln(\cosh t + \sin \sigma)$$

where $K(\sigma, r) \propto e^{-\frac{\sigma^2}{4r}}$.

G.C., G. Nardelli, arXiv:0708.0366 [hep-th]

Exact susy potential $U \propto (e^{r_*} \square \tilde{\phi}^2)^2$, Minkowski background ($R = 0$).

$$\psi(r, t) = - \int_{-\infty}^{+\infty} d\sigma \partial_\sigma K(\sigma, r) \ln(\cosh t + \sin \sigma)$$

where $K(\sigma, r) \propto e^{-\frac{\sigma^2}{4r}}$.

- A series representation is also available.

G.C., G. Nardelli, arXiv:0708.0366 [hep-th]

Exact susy potential $U \propto (e^{r_*} \square \tilde{\phi}^2)^2$, Minkowski background ($R = 0$).

Figure: $p = 1/2, \nu = -3/2, r = -1$

$$a = t^{H_0}, H = H_0 t^{-1}, \phi_{\text{loc}} = t^p$$

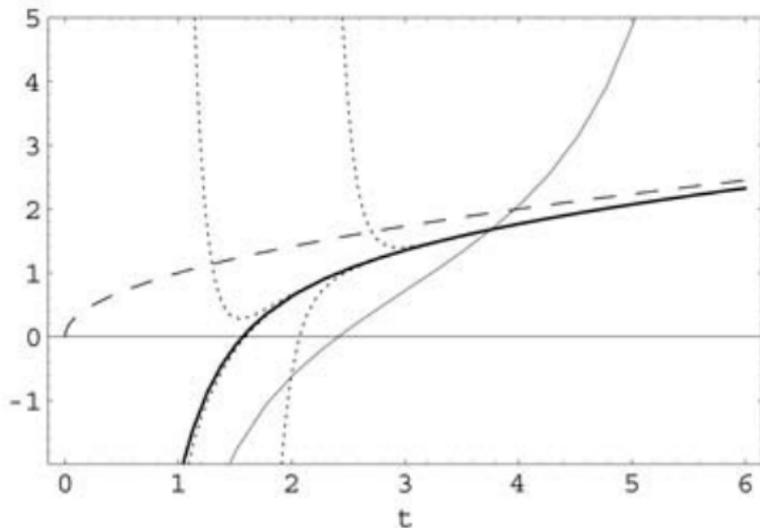

Figure: $p = 1/2, \nu = -3/2, r = 1$

Is $\psi(r, t)$ a solution?

- It is not a global solution but it is a local one (i.e., at late times) for braneworld models.

Is $\psi(r, t)$ a solution?

- It is not a global solution but it is a local one (i.e., at late times) for braneworld models.
- The situation in 4D is similar.

Achieved results

- Developed a **systematic** method by which to find **nonperturbative** solutions of **nonlocal** systems.

Achieved results
