Feynman Integral REduction

Reduction problem for Feynman integrals

A given Feynman graph $\Gamma \rightarrow$ tensor reduction \rightarrow various scalar Feynman integrals that have the same structure of the integrand with various distributions of powers of propagators

$$F(a_1, \dots, a_n) = \int \cdots \int \frac{d^d k_1 \dots d^d k_h}{E_1^{a_1} \dots E_n^{a_n}}.$$

$d = 4 - 2\epsilon$; the denominators E_r are either quadratic or linear with respect to the loop momenta $p_i = k_i$, $i = 1, \dots, h$ or to the independent external momenta $p_{h+1} = q_1, \dots, p_{h+N} = q_N$ of the graph.

Reduction problem for Feynman integrals

An **old analytical** strategy:
to evaluate, by some methods, every scalar Feynman
integral generated by the given graph.

Reduction problem for Feynman integrals

An **old analytical** strategy:

to evaluate, by some methods, every scalar Feynman integral generated by the given graph.

And what is already a **traditional** strategy:

to derive, without calculation, and then apply integration by parts (IBP) relations

[K.G. Chetyrkin and F.V. Tkachov'81]

between the given family of Feynman integrals as **recurrence relations**.

Reduction problem for Feynman integrals

An **old analytical** strategy:

to evaluate, by some methods, every scalar Feynman integral generated by the given graph.

And what is already a **traditional** strategy:

to derive, without calculation, and then apply integration by parts (IBP) relations

[K.G. Chetyrkin and F.V. Tkachov'81]

between the given family of Feynman integrals as **recurrence relations**.

A general integral from the given family is expressed as a linear combination of some basic (**master**) integrals.

Reduction problem for Feynman integrals

The whole problem of evaluation falls apart into two parts

Reduction problem for Feynman integrals

Reduction problem for Feynman integrals

The whole problem of evaluation falls apart into two parts

- constructing a reduction procedure
- evaluating master integrals

The talk is devoted to the first part of the problem.

Types of relations

Reduction problem for Feynman integrals

Types of relations

Most commonly used relations: IBP relations.

IBP:

[K.G. Chetyrkin and F.V. Tkachov'81]

$$\int \dots \int \mathbf{d}^d k_1 \dots \mathbf{d}^d k_n \frac{\partial}{\partial k_i} \left(p_j \frac{1}{E_1^{a_1} \dots E_n^{a_n}} \right) = 0 ,$$

Reduction problem for Feynman integrals

Types of relations

Most commonly used relations: IBP relations.

IBP:

[K.G. Chetyrkin and F.V. Tkachov'81]

$$\int \dots \int \mathbf{d}^d k_1 \dots \mathbf{d}^d k_n \frac{\partial}{\partial k_i} \left(p_j \frac{1}{E_1^{a_1} \dots E_n^{a_n}} \right) = 0 ,$$

→

$$\sum \alpha_i F(a_1 + b_{i,1}, \dots, a_n + b_{i,n}) = 0 ,$$

Reduction problem for Feynman integrals

Types of relations

$$\sum \alpha_i F(a_1 + b_{i,1}, \dots, a_n + b_{i,n}) = 0 ,$$

Lorentz-invariance (LI) identities

[T. Gehrmann and E. Remiddi'00]

→ they are a consequence of IBPs

[R. Lee'08]

Types of relations

symmetry relations, e.g.,

$$F(a_1, \dots, a_n) = (-1)^{d_1 a_1 + \dots + d_n a_n} F(a_{\sigma(1)}, \dots, a_{\sigma(n)}),$$

Types of relations

symmetry relations, e.g.,

$$F(a_1, \dots, a_n) = (-1)^{d_1 a_1 + \dots + d_n a_n} F(a_{\sigma(1)}, \dots, a_{\sigma(n)}),$$

Boundary conditions:

$$F(a_1, a_2, \dots, a_n) = 0 \text{ when } a_{i_1} \leq 0, \dots, a_{i_k} \leq 0$$

for some subsets of indices i_j ;

Types of relations

symmetry relations, e.g.,

$$F(a_1, \dots, a_n) = (-1)^{d_1 a_1 + \dots + d_n a_n} F(a_{\sigma(1)}, \dots, a_{\sigma(n)}),$$

Boundary conditions:

$$F(a_1, a_2, \dots, a_n) = 0 \text{ when } a_{i_1} \leq 0, \dots, a_{i_k} \leq 0$$

for some subsets of indices i_j ;

parity conditions,...

Manual reduction example

Massless one-loop propagator Feynman integrals

$$F(a_1, a_2) = \int \frac{d^d k}{(k^2)^{a_1} [(q - k)^2]^{a_2}} .$$

$$a_1 \geq 1, a_2 \geq 1$$

Reduction problem for Feynman integrals

$$\int \mathbf{d}^d k \frac{\partial}{\partial k} \cdot k \frac{1}{(k^2)^{a_1} [(q - k)^2]^{a_2}} = 0$$

Reduction problem for Feynman integrals

$$\int \mathbf{d}^d k \frac{\partial}{\partial k} \cdot k \frac{1}{(k^2)^{a_1} [(q-k)^2]^{a_2}} = 0$$

$$0 = dF(a_1, a_2) -$$

Reduction problem for Feynman integrals

$$\int \mathbf{d}^d k \frac{\partial}{\partial k} \cdot k \frac{1}{(k^2)^{a_1} [(q-k)^2]^{a_2}} = 0$$

$$0 = dF(a_1, a_2) - \\ -2a_1 F(a_1, a_2) -$$

Reduction problem for Feynman integrals

$$\int \mathbf{d}^d k \frac{\partial}{\partial k} \cdot k \frac{1}{(k^2)^{a_1} [(q-k)^2]^{a_2}} = 0$$

$$\begin{aligned} 0 = & dF(a_1, a_2) - \\ & -2a_1 F(a_1, a_2) - \\ & -a_2(q^2 F(a_1, a_2 + 1) - F(a_1 - 1, a_2 + 1) - F(a_1, a_2)) \end{aligned}$$

Reduction problem for Feynman integrals

$$\int \mathbf{d}^d k \frac{\partial}{\partial k} \cdot k \frac{1}{(k^2)^{a_1} [(q-k)^2]^{a_2}} = 0$$

$$\begin{aligned} 0 = & dF(a_1, a_2) - \\ & -2a_1 F(a_1, a_2) - \\ & -a_2(q^2 F(a_1, a_2 + 1) - F(a_1 - 1, a_2 + 1) - F(a_1, a_2)) \end{aligned}$$

$$\begin{aligned} F(a_1, a_2) = & -\frac{1}{(a_2 - 1)q^2} [(d - 2a_1 - a_2 + 1)F(a_1, a_2 - 1) \\ & - (a_2 - 1)F(a_1 - 1, a_2)] \end{aligned}$$

when $a_2 \neq 1$

To reduce the remaining integrals we use the symmetry condition $F(a_1, a_2) = F(a_2, a_1)$ (just to show an alternative way, we used only one IBP out of two, so IBPs are enough to do the reduction).

To reduce the remaining integrals we use the symmetry condition $F(a_1, a_2) = F(a_2, a_1)$ (just to show an alternative way, we used only one IBP out of two, so IBPs are enough to do the reduction).

Substituting the symmetry condition into the IBP used above we obtain:

$$F(a_1, 1) = -\frac{d - a_1 - 1}{(a_1 - 1)q^2} F(a_1 - 1, 1)$$

for $a_1 \geq 1$

Any integral can be recursively represented as a coefficient times $F(1, 1)$

Reduction problem for Feynman integrals

Relations between Feynman integrals lead to a possibility to express given Feynman integrals in terms of other Feynman integrals.

Reduction problem for Feynman integrals

Relations between Feynman integrals lead to a possibility to express given Feynman integrals in terms of other Feynman integrals.

$$\sigma_\nu = \{(a_1, \dots, a_n) : a_i > 0 \text{ if } i \in \nu, \ a_i \leq 0 \text{ if } i \notin \nu\}$$

A sector is σ_ν said to be **lower** than a sector σ_μ if $\nu \subset \mu$

Reduction problem for Feynman integrals

Sectors ('topologies'):

2^n **regions** labelled by subsets $\nu \subseteq \{1, \dots, n\}$:

$$\sigma_\nu = \{(a_1, \dots, a_n) : a_i > 0 \text{ if } i \in \nu, \ a_i \leq 0 \text{ if } i \notin \nu\}$$

A sector is σ_ν said to be **lower** than a sector σ_μ if $\nu \subset \mu$

$F(a_1, \dots, a_n) \succ F(a'_1, \dots, a'_n)$ if the sector of (a'_1, \dots, a'_n) is lower than the sector of (a_1, \dots, a_n) .

Reduction problem for Feynman integrals

Sectors (“topologies”):

2^n **regions** labelled by subsets $\nu \subseteq \{1, \dots, n\}$:

$$\sigma_\nu = \{(a_1, \dots, a_n) : a_i > 0 \text{ if } i \in \nu, \ a_i \leq 0 \text{ if } i \notin \nu\}$$

A sector is σ_ν said to be **lower** than a sector σ_μ if $\nu \subset \mu$

$F(a_1, \dots, a_n) \succ F(a'_1, \dots, a'_n)$ if the sector of (a'_1, \dots, a'_n) is lower than the sector of (a_1, \dots, a_n) .

To define an ordering completely introduce it in some way inside the sectors (to be discussed later).

Reduction problem for Feynman integrals

Laporta algorithm

[S. Laporta and E. Remiddi'96; S. Laporta'00; T. Gehrmann and E. Remiddi'01]

‘When increasing the total power of the denominator and numerator, the total number of IBP equations grows faster than the number of independent Feynman integrals. Therefore this system of equations sooner or later becomes overdetermined, and one obtains the possibility to perform a reduction to master integrals’

Laporta algorithm

But still... what are s -bases
and how to construct them?

Let's try to give an idea...

Although I would need several lectures like that to explain comprehensively what Gröbner bases are

s-bases approach

Suppose first that we are interested in expressing any integral in the positive sector $\sigma_{\{1,\dots,n\}}$ as a linear combination of a finite number of integrals in it.

$$\int \dots \int \mathbf{d}^d k_1 \dots \mathbf{d}^d k_N \frac{\partial}{\partial k_i} \left(p_j \frac{1}{E_1^{a_1} \dots E_N^{a_N}} \right) = 0$$

→

$$\sum c_i F(a_1 + b_{i,1}, \dots, a_n + b_{i,n}) = 0$$

s-bases approach

The left-hand sides of IBP relations can be expressed in terms of operators of multiplication by the indices a_i and shift operators $Y_i = \mathbf{i}^+$, $Y_i^- = \mathbf{i}^-$, where

$$(Y_i^\pm \cdot F)(a_1, \dots, a_n) = F(a_1, \dots, a_i \pm 1, \dots, a_n)$$

s-bases approach

The left-hand sides of IBP relations can be expressed in terms of operators of multiplication by the indices a_i and shift operators $Y_i = \mathbf{i}^+$, $Y_i^- = \mathbf{i}^-$, where

$$(Y_i^\pm \cdot F)(a_1, \dots, a_n) = F(a_1, \dots, a_i \pm 1, \dots, a_n)$$

Thus, one can choose certain elements f_i corresponding to IBP relations and write

$$(f_i \cdot F)(a_1, \dots, a_n) = 0$$

The choice is not unique, we will get rid of Y_i^-

s-bases approach

For example, the relation we had before

$$0 = dF(a_1, a_2) - 2a_1F(a_1, a_2) - a_2(q^2F(a_1, a_2 + 1) - F(a_1 - 1, a_2 + 1) - F(a_1, a_2))$$

s-bases approach

For example, the relation we had before

$$0 = dF(a_1, a_2) - 2a_1F(a_1, a_2) - \\ -a_2(q^2F(a_1, a_2 + 1) - F(a_1 - 1, a_2 + 1) - F(a_1, a_2))$$

can be rewritten as

$$((d - 2A_1 - A_2(q^2Y_2^+ - Y_1^-Y_2^+)) \cdot F)(a_1, a_2) = 0$$

For example, the relation we had before

$$0 = dF(a_1, a_2) - 2a_1F(a_1, a_2) - a_2(q^2F(a_1, a_2 + 1) - F(a_1 - 1, a_2 + 1) - F(a_1, a_2))$$

can be rewritten as

$$((d - 2A_1 - A_2(q^2Y_2^+ - Y_1^-Y_2^+)) \cdot F)(a_1, a_2) = 0$$

or after multiplying by Y_1^+ as

$$((dY_1^+ - 2(A_1 - 1)Y_1^+ - A_2(q^2Y_2^+Y_1^+ - Y_2^+)) \cdot F)(a_1, a_2) = 0$$

s-bases approach

The algebra \mathcal{A}^0 generated by shift operators Y_i^+ and multiplication operators A_i . It acts on the field of functions \mathcal{F} of n integer variables.

The **ideal \mathcal{I} of IBP relations** generated by the elements f_i .
For any element $X \in \mathcal{I}$ we have

$$(XF)(1, 1, \dots, 1) = 0 .$$

s-bases approach

The algebra \mathcal{A}^0 generated by shift operators Y_i^+ and multiplication operators A_i . It acts on the field of functions \mathcal{F} of n integer variables.

The **ideal \mathcal{I} of IBP relations** generated by the elements f_i .
For any element $X \in \mathcal{I}$ we have

$$(XF)(1, 1, \dots, 1) = 0 .$$

Also we have

$$F(a_1, a_2, \dots, a_n) = (Y_1^{a_1-1} \dots Y_n^{a_n-1} F)(1, 1, \dots, 1)$$

s-bases approach

The algebra \mathcal{A}^0 generated by shift operators Y_i^+ and multiplication operators A_i . It acts on the field of functions \mathcal{F} of n integer variables.

The **ideal \mathcal{I} of IBP relations** generated by the elements f_i . For any element $X \in \mathcal{I}$ we have

$$(XF)(1, 1, \dots, 1) = 0 .$$

Also we have

$$F(a_1, a_2, \dots, a_n) = (Y_1^{a_1-1} \dots Y_n^{a_n-1} F)(1, 1, \dots, 1)$$

The idea of the algorithm is to reduce the element in the right-hand side of the equation using the elements of the ideal \mathcal{I} .

s-bases approach

Suppose we are interested in an integral

$$F(a_1, a_2, \dots, a_n) = (Y_1^{a_1-1} \dots Y_n^{a_n-1} F)(1, 1, \dots, 1)$$

s-bases approach

Suppose we are interested in an integral

$$F(a_1, a_2, \dots, a_n) = (Y_1^{a_1-1} \dots Y_n^{a_n-1} F)(1, 1, \dots, 1)$$

The reduction problem \rightarrow
reduce the monomial $Y_1^{a_1-1} \dots Y_n^{a_n-1}$ modulo the ideal of
the IBP relations

$$Y_1^{a_1-1} \dots Y_n^{a_n-1} = \sum r_i f_i + \sum c_{i_1, \dots, i_n} Y_1^{i_1-1} \dots Y_n^{i_n-1}$$

Suppose we are interested in an integral

$$F(a_1, a_2, \dots, a_n) = (Y_1^{a_1-1} \dots Y_n^{a_n-1} F)(1, 1, \dots, 1)$$

The reduction problem \rightarrow
reduce the monomial $Y_1^{a_1-1} \dots Y_n^{a_n-1}$ modulo the ideal of the IBP relations

$$Y_1^{a_1-1} \dots Y_n^{a_n-1} = \sum r_i f_i + \sum c_{i_1, \dots, i_n} Y_1^{i_1-1} \dots Y_n^{i_n-1}$$

Apply to F at $a_1 = 1, \dots, a_n = 1$ to obtain

$$F(a_1, a_2, \dots, a_n) = \sum c_{i_1, \dots, i_n} F(i_1, i_2, \dots, i_n),$$

where integrals on the right-hand side are “master integrals”.

s-bases approach

To do the reduction we need an ordering of monomials of operators Y_i or, similarly, an ordering of points (a_1, \dots, a_n) in the sector:

For two monomials $M_1 = Y_1^{i_1-1} \dots Y_n^{i_n-1}$ and

$$M_2 = Y_1^{j_1-1} \dots Y_n^{j_n-1}$$

$(M_1 \cdot F)(1, \dots, 1) \succ (M_2 \cdot F)(1, \dots, 1)$ if and only if $M_1 \succ M_2$

Then the reduction procedure becomes similar to the division of polynomials. But one needs to introduce a proper ordering.

Orderings on the algebra of operators

Monomials \rightarrow degrees (sets of n non-negative integers).

We require the following properties:

- i) for any $a \in \mathbb{N}^n$ not equal to $(0, \dots, 0)$ one has $(0, \dots, 0) \prec a$
- ii) for any $a, b, c \in \mathbb{N}^n$ one has $a \prec b$ if and only if $a + c \prec b + c$.

Orderings on the algebra of operators

Monomials \rightarrow degrees (sets of n non-negative integers).

We require the following properties:

- i) for any $a \in \mathbb{N}^n$ not equal to $(0, \dots, 0)$ one has $(0, \dots, 0) \prec a$
- ii) for any $a, b, c \in \mathbb{N}^n$ one has $a \prec b$ if and only if $a + c \prec b + c$.

E.g., **lexicographical** ordering:

A set (i_1, \dots, i_n) is **higher** than a set (j_1, \dots, j_n) ,

$$(i_1, \dots, i_n) \succ (j_1, \dots, j_n)$$

if there is $l \leq n$ such that $i_1 = j_1, i_2 = j_2, \dots, i_{l-1} = j_{l-1}$ and $i_l > j_l$.

Orderings on the algebra of operators

Monomials \rightarrow degrees (sets of n non-negative integers).

We require the following properties:

- i) for any $a \in \mathbb{N}^n$ not equal to $(0, \dots, 0)$ one has $(0, \dots, 0) \prec a$
- ii) for any $a, b, c \in \mathbb{N}^n$ one has $a \prec b$ if and only if $a + c \prec b + c$.

E.g., **lexicographical** ordering:

A set (i_1, \dots, i_n) is **higher** than a set (j_1, \dots, j_n) ,

$$(i_1, \dots, i_n) \succ (j_1, \dots, j_n)$$

if there is $l \leq n$ such that $i_1 = j_1, i_2 = j_2, \dots, i_{l-1} = j_{l-1}$ and $i_l > j_l$.

Degree-lexicographical ordering: $(i_1, \dots, i_n) \succ (j_1, \dots, j_n)$ if $\sum i_k > \sum j_k$, or $\sum i_k = \sum j_k$ and $(i_1, \dots, i_n) \succ (j_1, \dots, j_n)$ in the sense of the lexicographical ordering.

The description of our approach

An ordering can be defined by a matrix.

Lexicographical, degree-lexicographical and reverse degree-lexicographical ordering for $n = 5$:

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix}, \quad \begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \end{pmatrix}, \quad \begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 1 & 1 & 1 & 1 & 0 \\ 1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 \end{pmatrix}$$

s-bases approach

- But the reduction does not always lead to a reasonable number of irreducible integrals → one has to build a special **basis** first.

s-bases approach

- But the reduction does not always lead to a reasonable number of irreducible integrals → one has to build a special **basis** first.
- Having elements with lowest possible degrees ↔ obtaining master integrals with minimal possible degrees.

s-bases approach

- But the reduction does not always lead to a reasonable number of irreducible integrals → one has to build a special **basis** first.
- Having elements with lowest possible degrees ↔ obtaining master integrals with minimal possible degrees.
- One needs to build special bases → an algorithm based on the Buchberger algorithm - S -polynomials, reductions.

s-bases approach

- But the reduction does not always lead to a reasonable number of irreducible integrals → one has to build a special **basis** first.
- Having elements with lowest possible degrees ↔ obtaining master integrals with minimal possible degrees.
- One needs to build special bases → an algorithm based on the Buchberger algorithm - S -polynomials, reductions.
- Moreover, we must keep in mind that we are interested in integrals not only in the positive sector.

Our algorithm [A.S.& V.S'05] : to build a set of special bases of the ideal of IBP relations (*s*-bases).

- sectors

$$\sigma_\nu = \{(a_1, \dots, a_n) : a_i > 0 \text{ if } i \in \nu, a_i \leq 0 \text{ if } i \notin \nu\}$$

- In the sector $\sigma_{\{1, \dots, n\}}$, consider Y_i as basic operators.

In the sector σ_ν , consider Y_i for $i \in \nu$ and Y_i^- for other i as basic operators.

- Construct **sector bases** (*s*-bases), rather than Gröbner bases for all the sectors.

An *s*-basis for a sector σ_ν is a set of elements of a basis which provides the possibility of a reduction to master integrals *and* integrals whose indices lie in *lower sectors*, i.e. $\sigma_{\nu'}$ for $\nu' \subset \nu$. (It is most complicated to construct *s*-bases for minimal sectors.)

s-bases approach

- The construction — close to the Buchberger algorithm but it can be terminated when the ‘current’ basis already provides us the needed reduction.
- The basic operations are the same, i.e. calculating S -polynomials and reducing them modulo current basis, with a chosen ordering.

After constructing s -bases for all non-trivial sectors one obtains a recursive (with respect to the sectors) procedure to evaluate $F(a_1, \dots, a_n)$ at any point and thereby reduce a given integral to master integrals.

Description of the algorithm (implemented in Mathematica):

[A.V. Smirnov, JHEP 0604 (2006) 026]

Main things you need to know about \mathcal{S} -bases:

Main things you need to know about s -bases:

- They are a method to work with IBPs before substituting indices

Main things you need to know about \mathcal{S} -bases:

- They are a method to work with IBPs before substituting indices
- Having as more bases as possible is nice

Main things you need to know about s -bases:

- They are a method to work with IBPs before substituting indices
- Having as more bases as possible is nice
- You can't construct them everywhere, but in many sectors they can be constructed automatically

Main things you need to know about s -bases:
