#### **The Game**

#### **QCD does a remarkable job!!!**

## QCD is just like QED,

## ... only different

QCD is just like QED, only different ...

#### QED: Abelian U(1) Symmetry

Perturbation theory at large distance is convergent

 $\alpha(\infty) \sim \frac{1}{137}$  $\alpha(M_Z) \sim \frac{1}{128}$ 

#### $\alpha$ is good expansion parameter

#### **QCD is Non-Abelian SU(3) Symmetry; Quarks are Confined!!!**

#### **Quark Confinement & String Interpretation**

Thomas Lippert, NIC-ZAM, Jülich, for the SESAM Collaboration)

http://www.scholarpedia.org/

http://en.wikipedia.org/ Quarks are confined

#### **Statement of the problem**

Theorist #1:	The universe is completely described by the symmetry group SO(10)
Theorist #2:	You're wrong; the correct answer is SuperSymmetric flipped SU(5)xU(1)
Theorist #3:	You've flipped! The only rational choice is E8xE8 dictated by SuperString Theology.
Experimentalist:	Enough of this speculative nonsense. I'm going to measure something to settle this question. What can you predict???
Theorist #1:	We can predict the interactions between fundamental particles such as quarks and leptons.
Experimentalist:	Great! Give me a beam of quarks and leptons, and I can settle this debate.
Accelerator	Operator: Sorry, quarks only come in a 3-pack and we can't break a set!

d,

#### **One interpretation of a hadron-hadron collision**

*Did we find the Higgs?* 

#### A bit more realistic interpretation of a hadron-hadron collision

## OUTLINE

**QCD** is a theory with a rich structure

Working in the limit of a spherical horse ...

We are going to look at the essence of what makes QCD so different from the other forces.

As a consequence, we will need to be creative in how we study the properties, now we define observables, and interpret the results.

QCD has a history of more than 40 years, and we are still trying to fully understand its structure.

## The goal of these lectures

Provide pictorial/graphical/heuristic explanations for everything that confused me as a student

AFTER

#### BEFORE

#### Lecture 1:

Overview& essential features Nature of strong coupling constant & how it varies with scale Issues beyond LO and SM Renormalization Group Equation & Resummation Scaling and the proton Structure

#### Lecture 2:

The structure of the proton descent Deeply Inelastic Scattering (DIS) The Parton Model contraction PDF's & Evolution descent Scaling and Scale Violation

#### Lecture 3:

Issues at NLO Collinear and Soft Singularities Mandelstam Variables An example from Freshman Physics Regularized Distributions Extension to higher orders

#### Lecture 4:

Drell-Yan and e<sup>+</sup>e<sup>-</sup> Processes W/Z/Higgs Production & Kinematics 3-body Phase Space & Dalitz Plots Sterman-Weinberg Jets Infrared Safe Observables Rapidity & Pseudo Rapidity Jet Definitions

#### Homework:

#### Physics is not a spectator sport

# Useful References & Thanks:

#### **Useful References**

An Introduction to QFT Peskin & Schroeder

Particle Data Group http://pdg.lbl.gov

The CTEQ Pedagogical Page Linked from cteq.org

Everything you wanted to know about Lambda-QCD but were afraid to ask Randall J. Scalise and Fredrick I. Olness

Regularization, Renormalization, and Dimensional Analysis: Dimensional Regularization meets Freshman E&M

Fredrick Olness & Randall Scalise

Calculational Techniques in Perturbative QCD: The Drell-Yan Process. Björn Pötter has prepared a writeup of the lecture given by Jack Smith. This is a wonderful reference for those learning to do real 1-loop calculations.

#### Thanks to ...

Thanks to:

Dave Soper, George Sterman, Steve Ellis for ideas borrowed from previous CTEQ introductory lecturers

Thanks to Randy Scalise for the help on the Dimensional Regularization.

Thanks to my friends at Grenoble who helped with suggestions and corrections.

Thanks to Jeff Owens for help on Drell-Yan and Resummation.

To the CTEQ and MCnet folks for making all this possible.

and the many web pages where I borrowed my figures ...

## The Strong Coupling, Scaling, and Stuff

#### QCD is Non-Abelian SU(3) Symmetry; Quarks are Confined

#### Where did that β-function come from ???

Consider a physical observable:  $R(Q^2/\mu^2, \alpha_s)$ 

Q is the characteristic energy scale of the problem  $\mu$  is an artificial scale we introduce to regulate the calculation (more later)

The Renormalization Group Equation (RGE) is:

$$\frac{dR}{d\mu^2} = 0$$

$$\left\{\mu^2 \frac{d}{d\mu^2}\right\} R(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)) = 0$$

Using the chain rule:

$$\begin{cases} \mu^2 \frac{\partial}{\partial \mu^2} + \left[ \mu^2 \frac{\partial \alpha_s(\mu^2)}{\partial \mu^2} \right] \frac{\partial}{\partial \alpha_s(\mu^2)} \\ \beta \left[ \alpha_s(\mu) \right] \end{cases} \begin{array}{c} R(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)) = 0 \\ \beta \left[ \alpha_s(\mu) \right] \\ \beta \left[ \alpha_s(\mu) \right] \end{array}$$

#### **The β-function:** $\beta(\alpha_{s}(\mu))$

 $\beta$  function tell us how  $\alpha_s$  changes with energy scale!!!

$$\beta(\alpha_s(\mu)) = \mu^2 \frac{\partial \alpha_s(\mu^2)}{\partial \mu^2} = \frac{\partial \alpha_s(\mu^2)}{\partial \ln \mu^2}$$

We can calculate this perturbatively

$$\beta[\alpha_s(\mu)] = - \{b_0\alpha_s^2 + b_1\alpha_s^3 + b_2\alpha_s^4 + ...\}$$

$$b_0 = \frac{33 - 2N_F}{12\pi}$$

$$\beta = -\alpha_s^2 \left[ \frac{33 - 2N_F}{12\pi} \right] + \dots$$

Note:  $b_0$  and  $b_1$  are scheme independent.  $\beta$  is negative; let's find the implications

#### **Solve for the running coupling**

Observe  $\beta_{QCD} < 0$  for  $N_F < 17$  or for 8 generations or less. Thus, in general  $\beta_{QCD} < 0$  in the QCD theory Contrast with QED:  $\beta_{OED} > 0 = +\alpha^2/3\pi + ...$ 

The Nobel Prize in Physics 2004 was awarded jointly to David J. Gross, H. David Politzer and Frank Wilczek "for the discovery of asymptotic freedom

#### Solve for the running coupling and $A_{QCD}$

Let: 
$$t = \ln \mu^2$$
  
 $\frac{1}{\alpha_S} \Big]_{\mu_0}^{\mu_1} = b_0 t \Big]_{\mu_0}^{\mu_1}$ 
(f) by region of the derivative o

 $\beta$  functions gives us running, but we still need a reference

Energy Scale t

$$lpha_s(\mu) = rac{1}{b_0 \ln(\mu/\Lambda_{QCD})}$$
  
Landau Pole  
 $\Lambda = \mu$ 

$$\Lambda = \mu \, e^{-1/(b_0 \, \alpha_s(\mu))}$$

 $\Lambda_{QCD} \sim 200 \,\mathrm{MeV} \sim 1 \,\mathrm{fm}$ 

$$b_1 = 0 + (2/3)N_F + \frac{1}{10}N_{Higgs}$$
  

$$b_2 = -22/3 + (2/3)N_F + \frac{1}{6}N_{Higgs}$$
  

$$b_3 = -11 + (2/3)N_F + 0$$

#### **Comparison with data**

 $\alpha_s(M_Z) = 0.118$ 

Low Q points have more discriminating power

Caution:  $\alpha_s$  is NOT a physical observable

Siegfried Bethke Eur.Phys.J.C64:689-703,2009

## **BEYOND NLO**

At 1-loop and 2-loops, continuous at thresholds

At  $O(\alpha_s^3)$ , not even

continuous at thresholds

At  $O(\alpha_s^3)$ , not even continuous at thresholds

**Un-physical theoretical constructs:** *(E.g., as, PDFs, ...)* 

Cannot be measured directly

Depends on Schemes Renormalization Schemes: *MS, MS-Bar, DIS* 

Renormalization Scale m

Depends on Higher Orders

**Physical Observables** 

Measure directly

Independent of Schemes/Definitions

Independent of Higher Orders

 $\alpha_{(n_f)}(M) = \alpha_{(n_f-1)}(M) - \frac{11}{72\pi^2} \alpha^3_{(n_f-1)}(M) + \mathcal{O}(\alpha^4_{(n_f-1)})$ 

## **BEYOND SM**

$$b_1 = 0 + (2/3)N_F + \frac{1}{10}N_{Higgs}$$
  

$$b_2 = -22/3 + (2/3)N_F + \frac{1}{6}N_{Higgs}$$
  

$$b_3 = -11 + (2/3)N_F + 0$$

#### **Can we do better???**

#### The Standard Model (SM) & SUSY Running Couplings

 $b_1 = 0 + (2/3)N_F + \frac{1}{10}N_{Higgs}$   $b_2 = -22/3 + (2/3)N_F + \frac{1}{6}N_{Higgs}$  $b_3 = -11 + (2/3)N_F + 0$ 

$$\beta_0 = 11 - \frac{2}{3} \left( N_f + 3N_{\tilde{g}} + \frac{1}{4}N_{\tilde{f}} \right)$$

We've only discovered half the particles

New particles effects evolution of  $\alpha_{s}(\mu)$ 

#### The Standard Model (SM) & SUSY Running Couplings

$$p_0 = \frac{1}{12\pi} \left\{ 33 - 2N_F - 6N_{\tilde{g}} - \frac{1}{2}N_{\tilde{F}} \dots \right\}$$

#### GOT QCD ???

CDF Collaboration, PRL 77, 438 (1996)

Indispensable for discovery of "new physics"

## RESUMMATION

See lecture by Jeff Owens

GOAL: Pythagorean Theorem

METHOD: Dimensional Analysis

$$\theta c \qquad A_c = c^2 f(\theta, \phi)$$

 $A_a + A_b = A_c$ 

$$a^2+b^2=c^2$$

Two examples to come: 1) Resummation, and 2) Scaling

**Resummation: Over-Simplified** 

$$\left\{\mu^2 \frac{\partial}{\partial \mu^2} + \beta \left(\alpha_s(\mu)\right) \frac{\partial}{\partial \alpha_s(\mu^2)}\right\} R\left(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)\right) = 0$$
Logs can spoil perturbed

Logs can be large and spoil perturbation theory

If we expand R in powers of  $\alpha_s$ , and we know  $\beta$ , we then know  $\mu$  dependence of R.  $R(\frac{\mu^{2}}{Q^{2}}\alpha_{s}(\mu^{2})) = R_{0} + \alpha_{s}(\mu^{2}) R_{1} [\ln(Q^{2}/\mu^{2}) + c_{1}]$ + $\alpha_s^2(\mu^2) R_2 \left[ \ln^2(Q^2/\mu^2) + \ln(Q^2/\mu^2) + c_2 \right] + O(\alpha_s^3(\mu^2))$ Since  $\mu$  is arbitrary, choose  $\mu = Q$ .  $R(\frac{Q^{2}}{Q^{2}}, \alpha_{s}(Q^{2})) = R_{0} + \alpha_{s}(Q^{2}) R_{1}[0 + c_{1}] + \alpha_{s}^{2}(Q^{2}) R_{2}[0 + 0 + c_{2}] + \dots$ We just summed the logs

**QCD** is non-abelian SU(3) Symmetry  $\Rightarrow$  confinement

More Differential Quantities  $\Rightarrow$  More Mass Scales  $\Rightarrow$  More Logs!!!

$$\frac{d\sigma}{dQ^2} \sim \ln\left(\frac{Q^2}{\mu^2}\right) \qquad \qquad \frac{d\sigma}{dQ^2} \sim \ln\left(\frac{Q^2}{\mu^2}\right) \quad and \quad \ln\left(\frac{q_T^2}{\mu^2}\right)$$

How do we resum logs? Use the Renormalization Group Equation

For a physical observable R:

$$\mu \; \frac{dR}{d \; \mu} \; = \; 0$$

$$\mu \; \frac{dR}{d \; Gauge} \; = \; 0$$

Applied to boson transverse momentum CSS: Collins, Soper, Sterman Nucl.Phys.B250:199,1985.

Interesting reference: Peskin/Schroeder Text (*Renomalization ala Ken Wilson*)

# Scaling, and the proton structure

#### How do we determine the proton structure

Quarks confined, thus we must work with hadrons & mesons *E.g. proton is a "minimal" unit*Highest energy (smallest distance) accelerators involve hadrons *E.g., HERA, TEV, LHC*We'd better learn to work with proton

$$d\sigma \sim \frac{4\pi\alpha^2}{Q^2} \times 1$$

$$d\sigma \sim \frac{4\pi\alpha^2}{Q^2} \times 1$$

$$d\sigma \sim \frac{4\pi\alpha^2}{Q^2} \times 1$$

$$d\sigma \sim \frac{4\pi\alpha^2}{Q^2} \times 1$$
Dimensional considerations
Structure Function

Is this a point like particle ???

We found the Higgs

# Scaling, and the proton structure

#### **Relative Sizes**

Going to smaller scale, we get to simpler, more fundamental objects

#### **Structure of the Proton**

#### **The Scaling of the Proton Structure Function**

- QCD is just like QED, ... only different
  - QCD is non-Abelian, Quarks are confined,
- Running coupling  $\alpha_{s}(\mu)$  tells how interaction changes with distance
  - $\beta$ -function: logarithmic derivative of  $\alpha_s(\mu)$
  - We can compute: Negative for QCD, positive for QED
- $\alpha_{s}(\mu)$  is <u>not</u> a physical quantity
  - Discontinous at NNLO
- New physics can influence  $\alpha_s(\mu)$ 
  - Unification of couplings at GUT scale
- Running of  $\alpha_s(\mu)$  can help us "resum" perturbation theory
- Scaling and Dimensional Analysis are useful tools

## END OF LECTURE 1
