  - Features of the code
  - Results
- Summary

In collaboration with S. Catani, D. de Florian, G. Ferrera and M. Grazzini

Why is diphoton production important?

- It is a channel that we can use to check the validity of perturbative Quantum Chromodynamics (pQCD)
  - Collinear factorization approach
  - K_T factorization approach
  - Soft gluon logarithmic resummation techniques

- It constitutes an irreducible background for new physics searches
  - Universal Extra Dimensions
  - Randall-Sundrum ED
  - Supersymmetry
  - New heavy resonances

- **Irreducible background**
  - **In searches for a low mass Higgs boson decaying into photon pairs**

Why is diphoton production important?

The search for the SM Higgs boson

- Direct searches at LEP2 experiments → $M_{Higgs} < 114\ GeV/c^2$ (95% C.L.)
  Phys. Lett. B 565 (2003) 61

One of the most promising channels at the LHC is the rare decay of the Higgs boson into a pair of photons

$H \rightarrow \gamma\gamma$

- Combined results ATLAS – CMS → $141\ GeV/c^2 < M_{Higgs} < 476\ GeV/c^2$ (95% C.L.)
  Phys.Lett. B705 (2011) 452–470
  ATLAS-CONF-2011-149
  CMS-PAS-HIG-11-021
  arXiv:1201.3084 [hep-ph]

The search for the SM Higgs boson

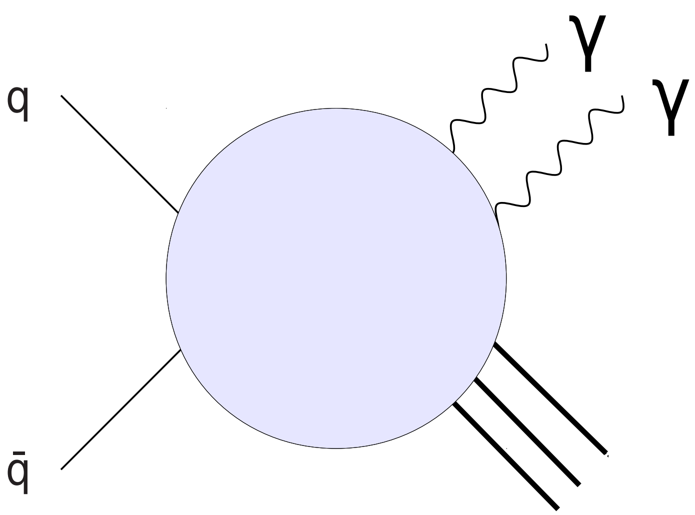
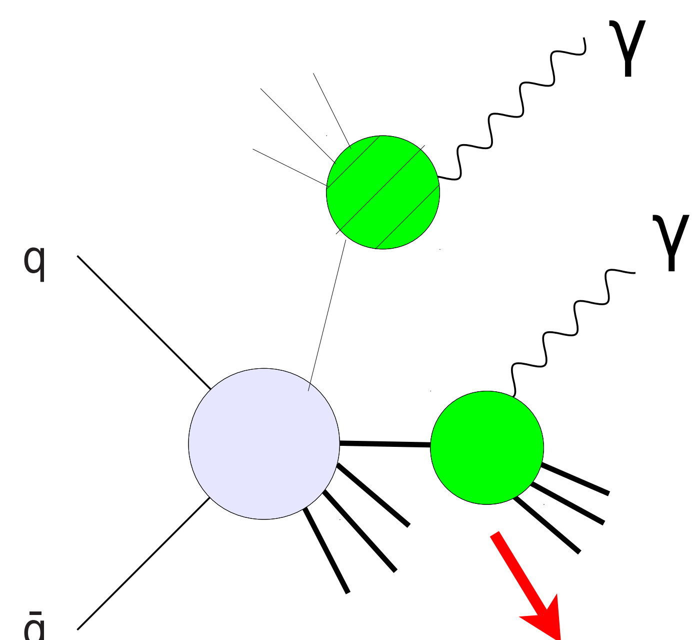
Photon production

When dealing with the production of photons we have to consider two production mechanisms:



Direct component: photon directly produced through the hard interaction



Fragmentation function: to be fitted from data

Fragmentation component: photon produced from non-perturbative fragmentation of a hard parton (analogously to a hadron)

Single and double resolved (collinear fragmentation)

Calculations of cross sections with photons have additional singularities in the presence of QCD radiation. (i.e. When we go beyond LO)

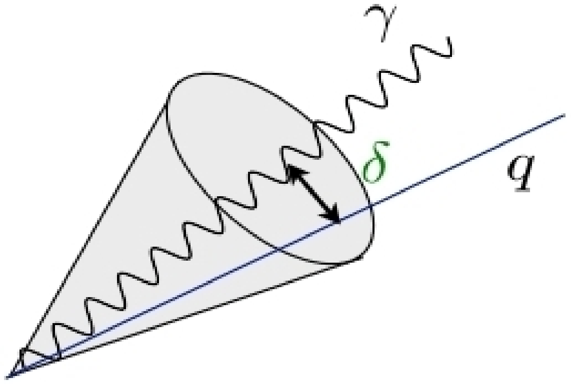
When quark and photon are collinear → singular propagator

See R. Hernandez-Pinto's and P. Artoisenet's presentation!

Photon production

- Experimentally photons must be isolated
- Isolation reduces fragmentation component → Large Corrections
- Experimentalist may choose:

$$\sum_{\delta<R_0} E_T^{had} \leq \varepsilon_\gamma p_T^\gamma$$



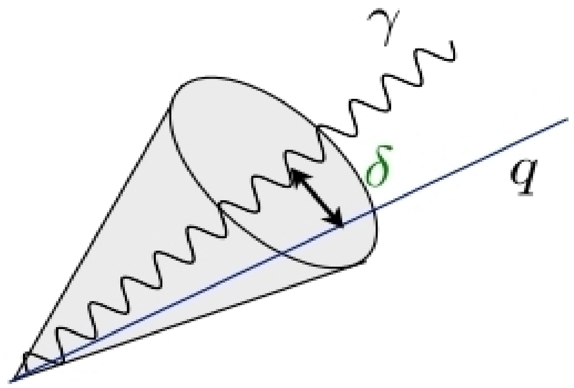
$$\sum_{\delta<R_0} E_T^{had} \leq E_T^{max}$$

Using conventional isolation, only the sum of the direct and fragmentation contributions is meaningful.

Photon production

- Experimentally photons must be isolated
- Isolation reduces fragmentation component → Large Corrections
- Experimentalist may choose:

$$\sum_{\delta<R_0} E_T^{had} \leq \varepsilon_\gamma p_T^\gamma$$



$$\sum_{\delta<R_0} E_T^{had} \leq E_T^{max}$$

Using conventional isolation, only the sum of the direct and fragmentation contributions is meaningful.

But there is a way to isolate and make the direct cross section physical

(Infrared safe)

Smooth cone Isolation

S. Frixione, Phys.Lett. B429 (1998) 369–374,

Soft emission allowed arbitrarily close to the photon

$$\chi(\delta) = \epsilon_\gamma E_T^\gamma \left(\frac{1-\cos(\delta)}{1-\cos(R_0)}\right)^n$$

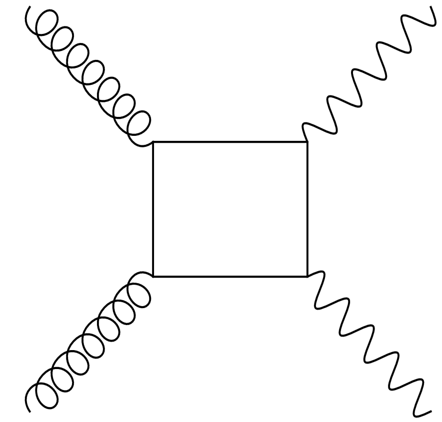
$E_T^{had}(\delta) \leq \chi(\delta)$ **such that** $\lim_{\delta\to 0} \chi(\delta) = 0$

- no quark-photon collinear divergences
- no fragmentation component (only direct)
- direct well defined by itself

Available theoretical tools

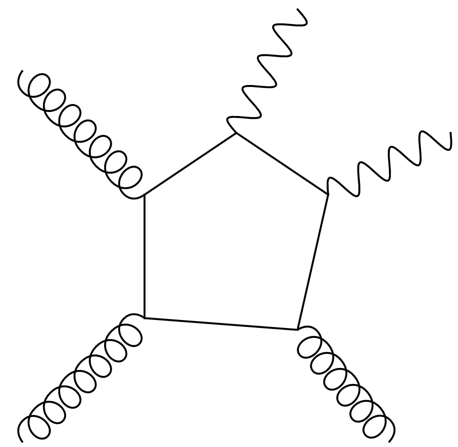
DIPHOX Full NLO for direct and fragmentation
+ Box contribution (one piece of NNLO)

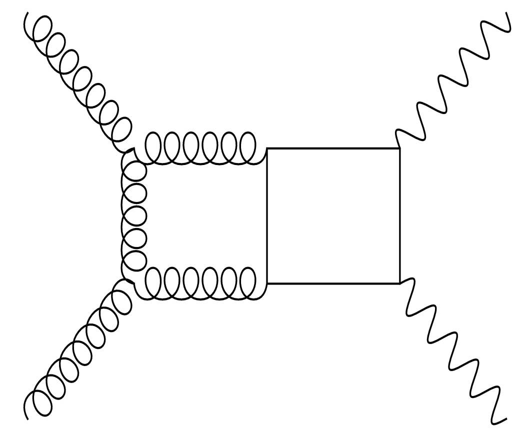
T. Binoth, J.Ph. Guillet, E. Pilon and M. Werlen



gamma2MC Full NLO (direct only) + Box
+ correction to Box contribution partial N^3LO term

Zvi Bern, Lance Dixon, and Carl Schmidt





MCFM Full NLO for direct, but only LO for fragmentation
+ correction to Box contribution partial N^3LO term

John M. Campbell, R.Keith Ellis, Ciaran Williams

Resbos NLL q_T resummation for direct (with regulator for collinear singularities)
Correction to Box contribution partial N^3LO term

C. Balázs, E. L. Berger, P. Nadolsky, and C.-P. Yuan

C. Balázs, E. L. Berger, P. Nadolsky, and C.-P. Yuan

Correction to Box contribution partial N^3LO term

Results tipically in good agreement with data, but some differences observed:

- **Azimuth separation for diphoton production**
- **Low mass region of the invariant mass distribution**

It is desireable to count on a NNLO description of the phenomenology of diphoton production

Diphoton production with 2γNNLO

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

- Based on the q_T subtraction formalism S. Catani, M. Grazzini
- Fully exclusive NNLO description(direct contribution) for $pp(\bar{p}) \rightarrow \gamma\gamma$
- No fragmentation contribution

Frixione Isolation

- Also corrections to Box contribution, partial N^3LO terms available

Zvi Bern, Lance Dixon, and Carl Schmidt

(Available, but not present in the following analysis)

Full NNLO means full control of the $\mathcal{O}\left(\alpha_s^2\right)$ diagrams:

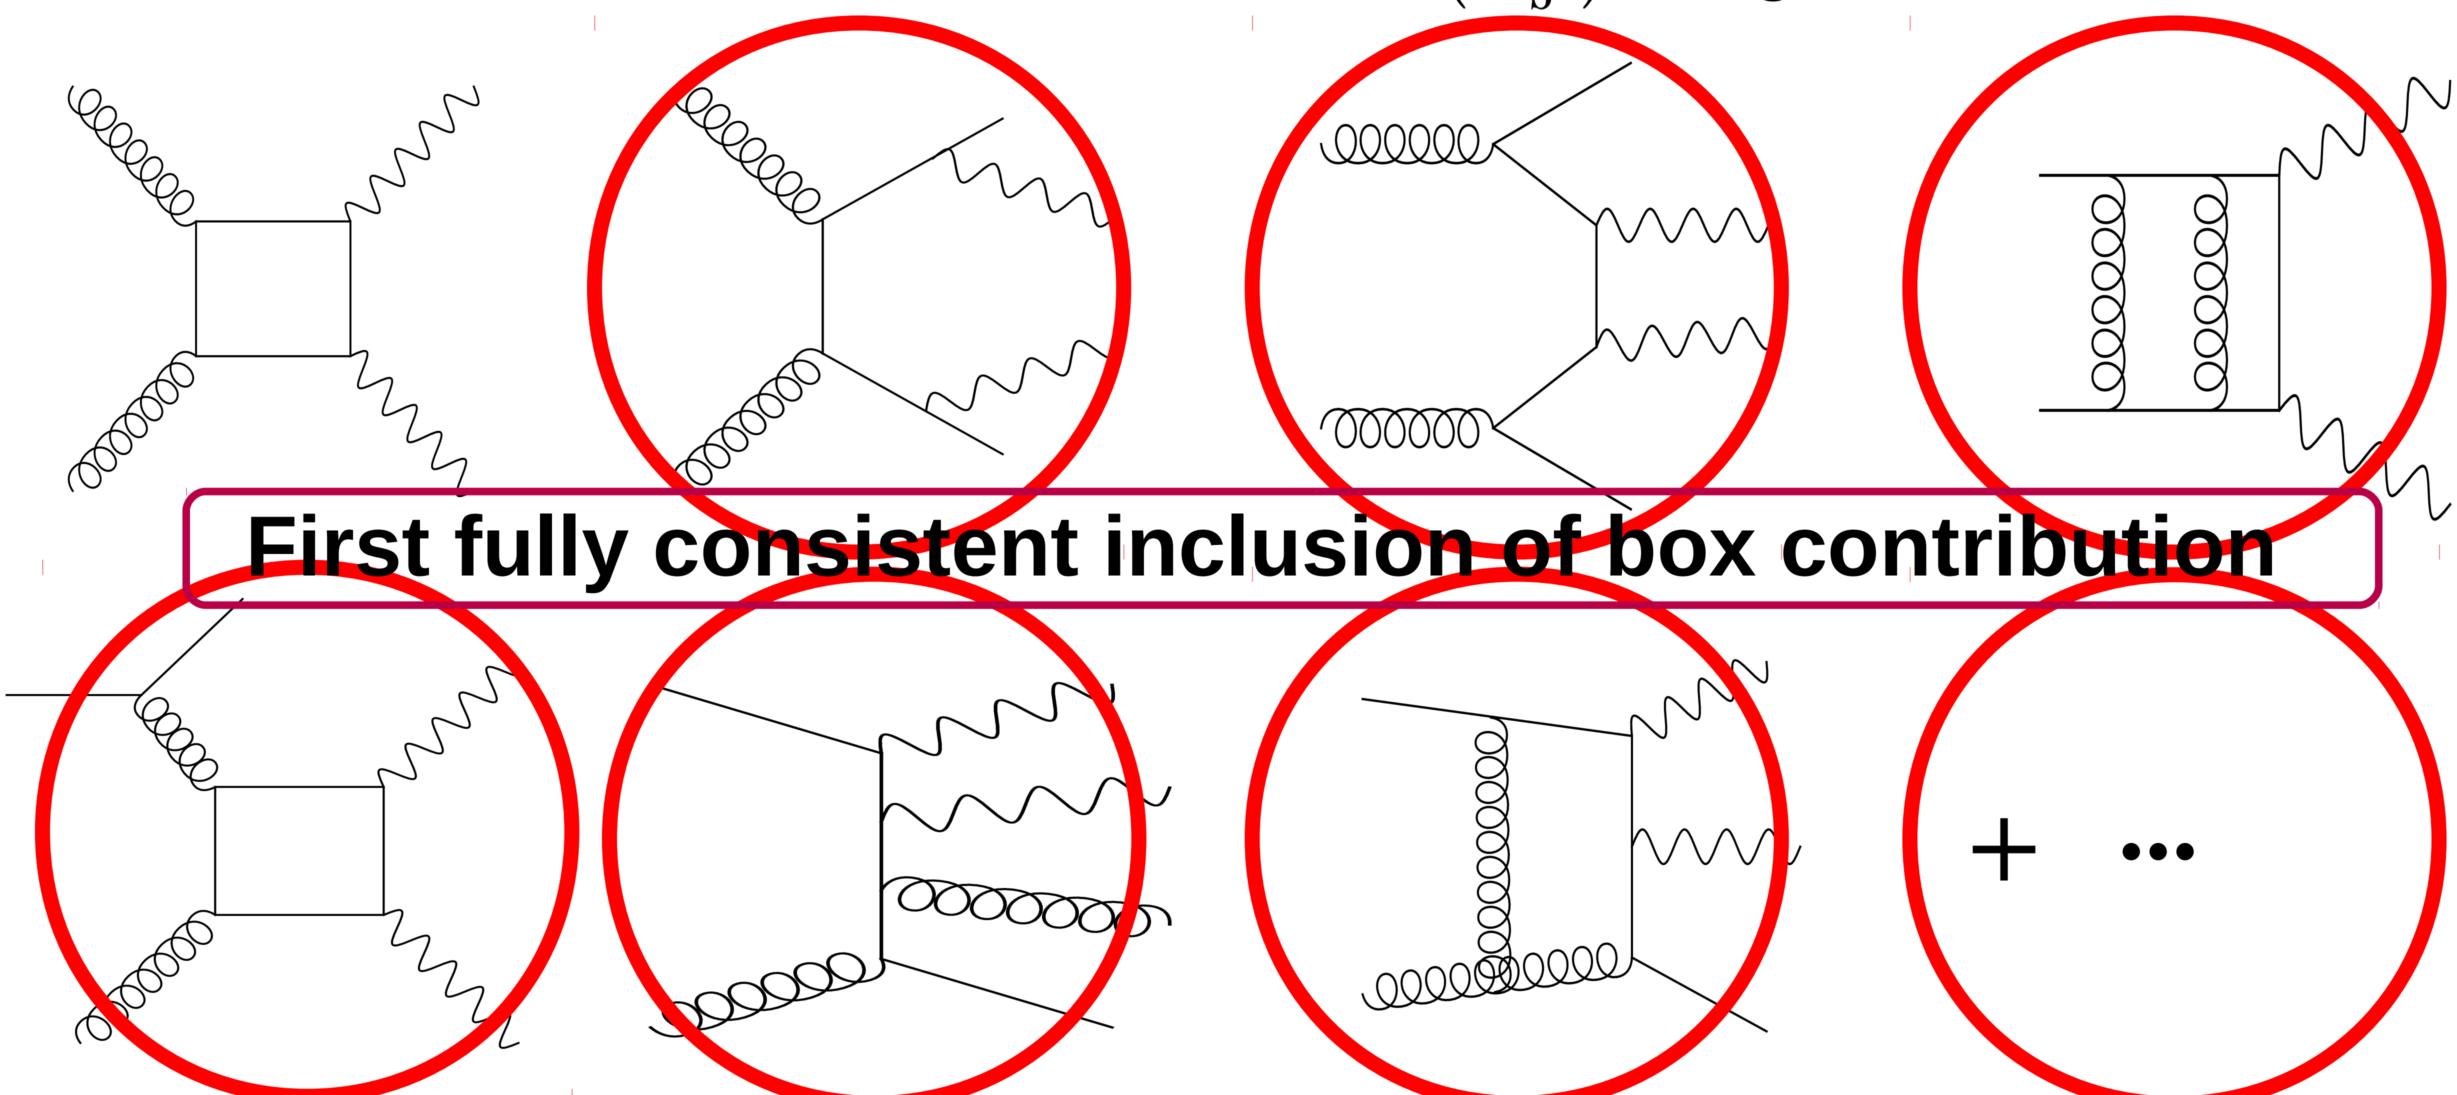
Full NNLO means full control of the $\mathcal{O}\left(\alpha_s^2\right)$ diagrams:



First fully consistent inclusion of box contribution

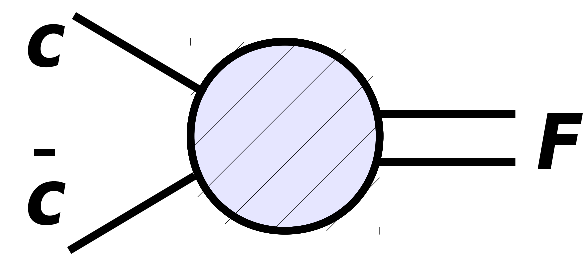
q_T subtraction method

S. Catani, M. Grazzini (2007)

Let us consider a specific, though important class of processes: the production of colourless high-mass systems ***F*** in hadron collisions

(***F*** may consist of lepton pairs, vector bosons, Higgs bosons......)

At LO it starts with $c\bar{c} \longrightarrow F$



Strategy: start from NLO calculation of ***F+jet(s)*** and observe that as soon as the transverse momentum of the ***F***, $q_T \neq 0$, on can write:

$$d\sigma^{F}_{(N)NLO}\big|_{q_T \neq 0} = d\sigma^{F+\text{jets}}_{(N)LO}$$

Define a counterterm to deal with singular behaviour at $q_T \to 0$

But.....

the singular behaviour of $d\sigma^{F+\text{jets}}_{(N)LO}$ is well known from the resummation program of large logarithmic contributions at small transverse momenta

G. Parisi, R. Petronzio (1979)
J. Collins, D.E. Soper, G. Sterman (1985)
S. Catani, D. de Florian, M.Grazzini (2000)

q_T subtraction method

S. Catani, M. Grazzini (2007)

choose $$d\sigma^{CT} \sim d\sigma^{(LO)} \otimes \Sigma^F(q_T/Q)$$

where $$\Sigma^F(q_T/Q) \sim \sum_{n=1}^{\infty} \left(\frac{\alpha_S}{\pi}\right)^n \sum_{k=1}^{2n} \Sigma^{F(n;k)} \frac{Q^2}{q_T^2} \ln^{k-1} \frac{Q^2}{q_T^2}$$

Then the calculation can be extended to include the $q_T = 0$ contribution:

$$d\sigma^F_{(N)NLO} = \mathcal{H}^F_{(N)NLO} \otimes d\sigma^F_{LO} + \left[d\sigma^{F+\text{jets}}_{(N)LO} - d\sigma^{CT}_{(N)LO}\right]$$

where I have subtracted the truncation of the counterterm at (N)LO and added a contribution at $q_T = 0$ to restore the correct normalization

The function $\mathcal{H}^F$ can be computed in QCD perturbation theory

$$\mathcal{H}^F = 1 + \left(\frac{\alpha_S}{\pi}\right)\mathcal{H}^{F(1)} + \left(\frac{\alpha_S}{\pi}\right)^2 \mathcal{H}^{F(2)} + \ldots\ldots$$

q_T subtraction method

S. Catani, M. Grazzini (2007)

For a generic $pp \to F + X$ process:

- At NLO we need a LO calculation of $d\sigma^{F+\mathrm{jet(s)}}$ plus the knowledge of $d\sigma^{CT}_{LO}$ and $\mathcal{H}^{F(1)}$
  - the counterterm $d\sigma^{CT}_{LO}$ requires the resummation coefficients $A^{(1)}, B^{(1)}$ and the one loop anomalous dimensions
  - the general form of $\mathcal{H}^{F(1)}$ is known

D. de Florian, M. Grazzini (2000)
G. Bozzi, S. Catani, D. de Florian, M.Grazzini (2005)

- At NNLO we need a NLO calculation of $d\sigma^{F+\mathrm{jet(s)}}$ plus the knowledge of $d\sigma^{CT}_{NLO}$ and $\mathcal{H}^{F(2)}$
  - the counterterm $d\sigma^{CT}_{NLO}$ depends also on the resummation coefficients $A^{(2)}, B^{(2)}$ and on the two loop anomalous dimensions
  - we have computed $\mathcal{H}^{F(2)}$ for Higgs and vector boson production!
  - generalized to any process with final state colorless system ***F***

S. Catani, M. Grazzini (2007)
S. Catani, L. C, G.Ferrera, D. de Florian, M. Grazzini (2009)
S. Catani, L. C, G.Ferrera, D. de Florian, M. Grazzini (2011)

q_T subtraction method

S. Catani, M. Grazzini (2007)

For a generic $pp \to F + X$ process:

This is enough to compute NNLO corrections for *any* process in this class provided that F+jet is known up to NLO and the two loop amplitude for $c\bar{c} \to F$ is known

- At NNLO we need a NLO calculation of $d\sigma^{F+\mathrm{jet(s)}}$ plus the knowledge of $d\sigma^{CT}_{NLO}$ and $\mathcal{H}^{F(2)}$
  - the counterterm $d\sigma^{CT}_{NLO}$ depends also on the resummation coefficients $A^{(2)}, B^{(2)}$ and on the two loop anomalous dimensions
  - we have computed $\mathcal{H}^{F(2)}$ for Higgs and vector boson production!
  - generalized to any process with final state colorless system ***F***

Fully exclusive NNLO code for $pp \to F$

2γNNLO

First exclusive NNLO in pp collisions with two final state particles

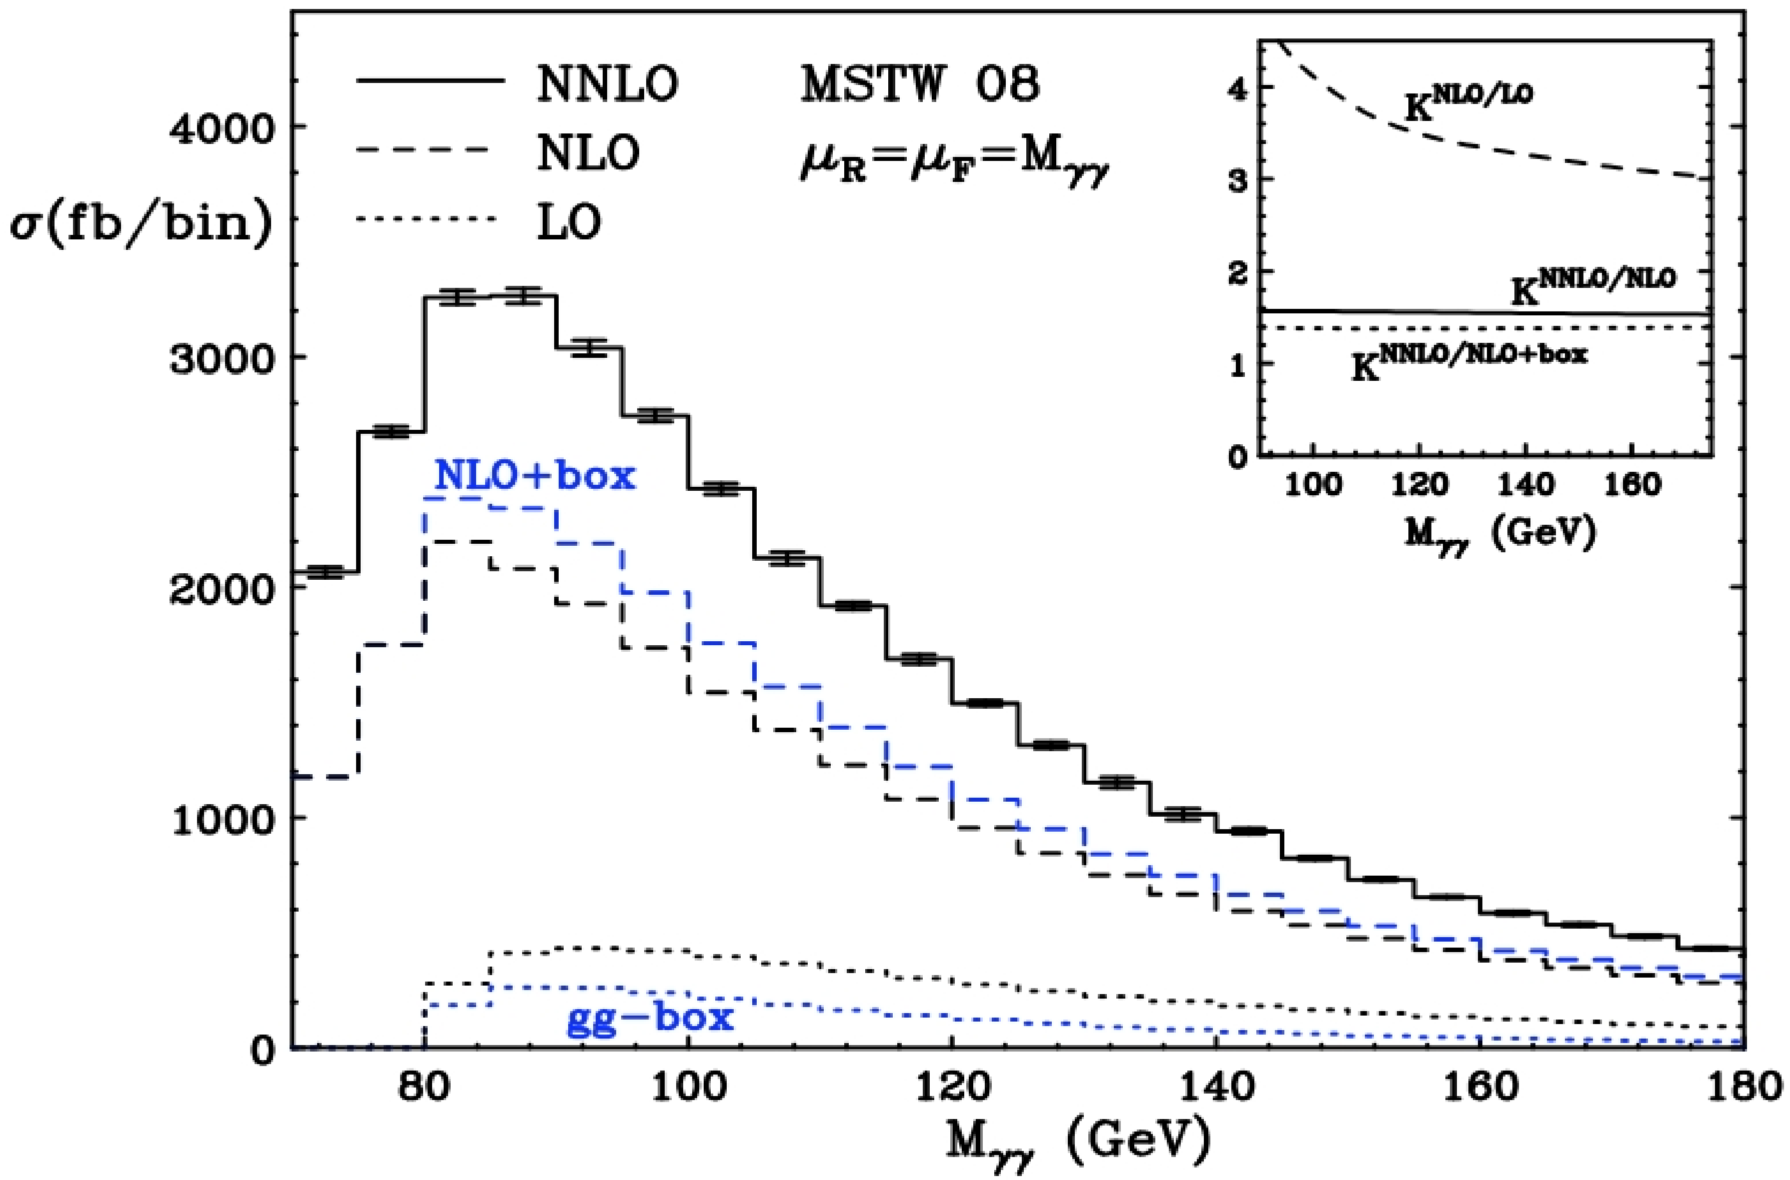
S.Catani, L.Cieri, D.de Florian, G.Ferrera, M.Grazzini (2011)

Diphoton production at NNLO

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

First exclusive NNLO with two final state particles

First results using $2\gamma\mathrm{NNLO}$



$\sqrt{S} = 14\,\mathrm{TeV}$

$p_T^{\gamma\,hard} \geq 40\,\mathrm{GeV}$

$p_T^{\gamma\,soft} \geq 25\,\mathrm{GeV}$

$|\eta^\gamma| \leq 2.5$

$20\,\mathrm{GeV} \leq M_{\gamma\gamma} \leq 250\,\mathrm{GeV}$

$\mu_R = \mu_F = M_{\gamma\gamma}$

NNLO effect about +50 % in the peak region

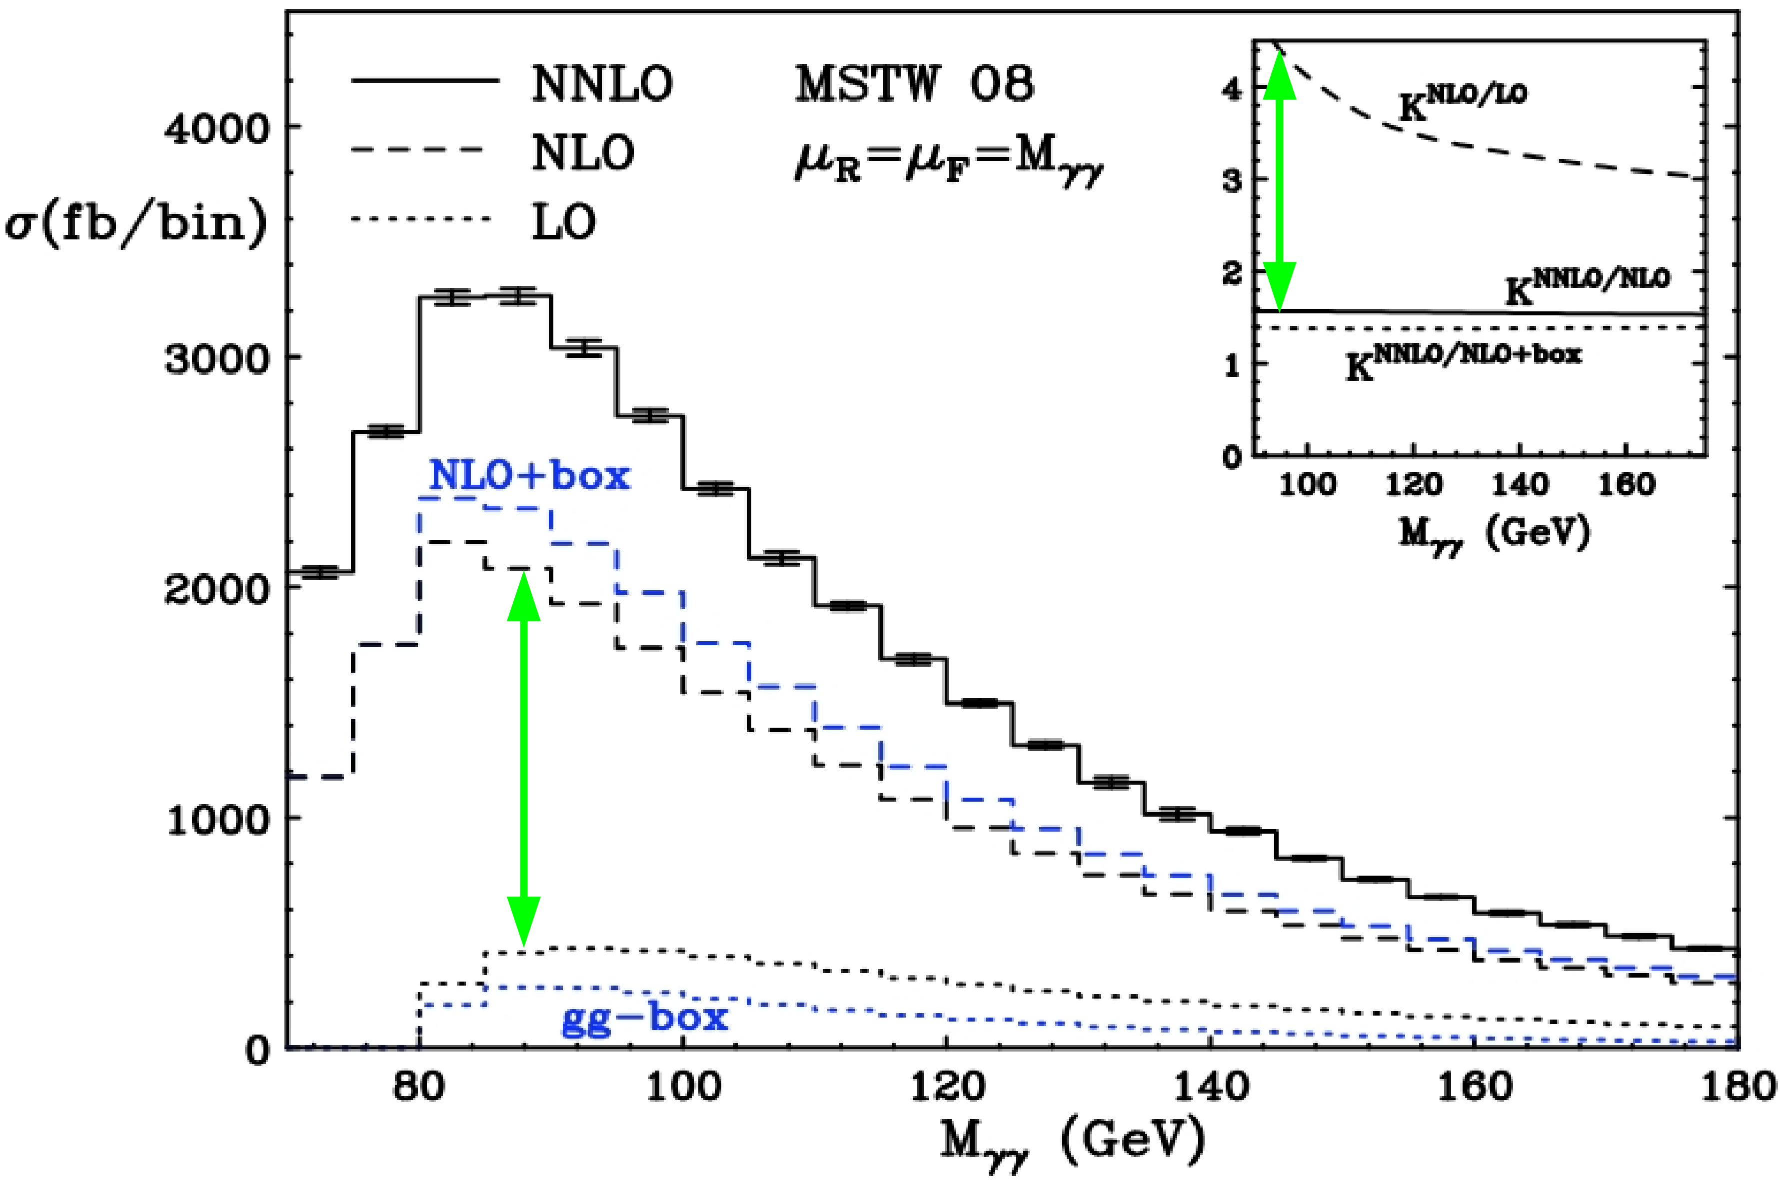
Box only ~22% of NNLO correction

Diphoton production at NNLO

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

First exclusive NNLO with two final state particles

First results using $2\gamma\mathrm{NNLO}$



$\sqrt{S} = 14\,\mathrm{TeV}$

$p_T^{\gamma\, hard} \geq 40\,\mathrm{GeV}$

$p_T^{\gamma\, soft} \geq 25\,\mathrm{GeV}$

$|\eta^\gamma| \leq 2.5$

$20\,\mathrm{GeV} \leq M_{\gamma\gamma} \leq 250\,\mathrm{GeV}$

$\mu_R = \mu_F = M_{\gamma\gamma}$

$$\frac{\sigma^{NNLO}}{\sigma^{NLO+Box}} \sim 1.35$$

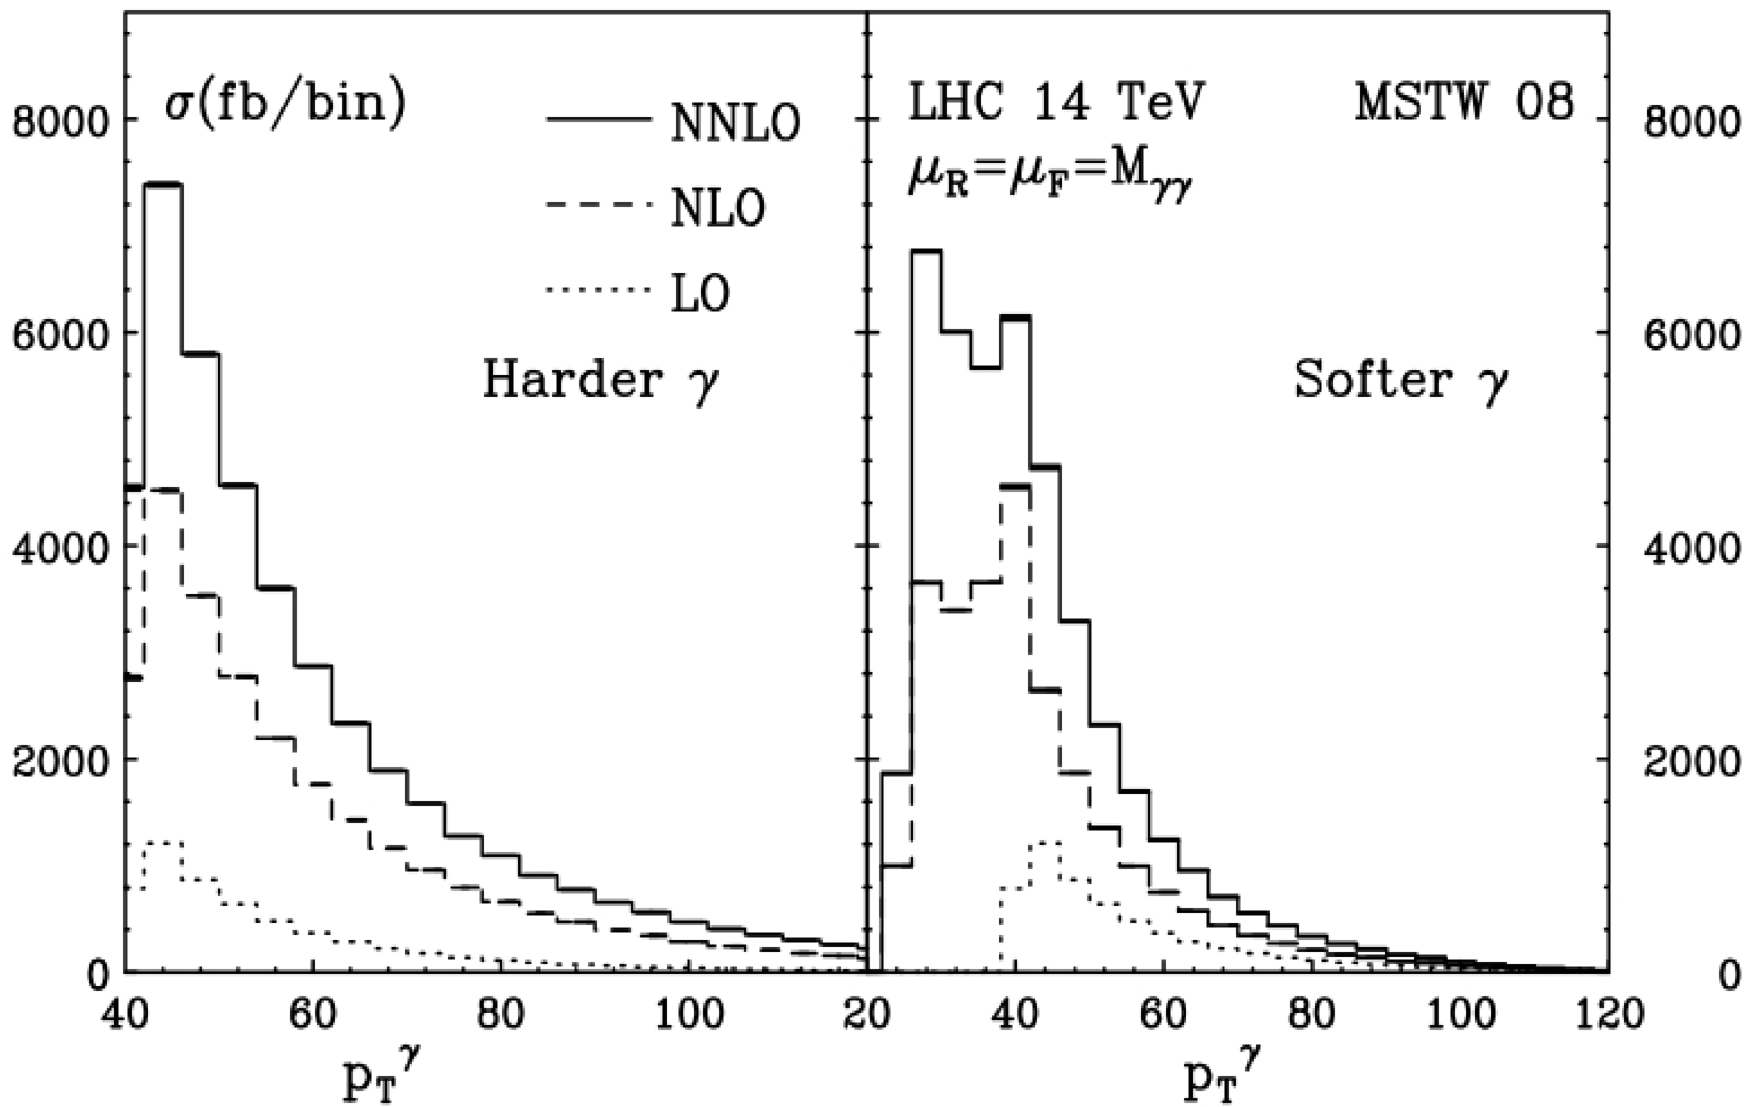
$$\frac{\sigma^{NNLO}}{\sigma^{NLO}} \sim 1.55$$

Diphoton production at NNLO

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

First exclusive NNLO with two final state particles

p_T of harder and softer photon



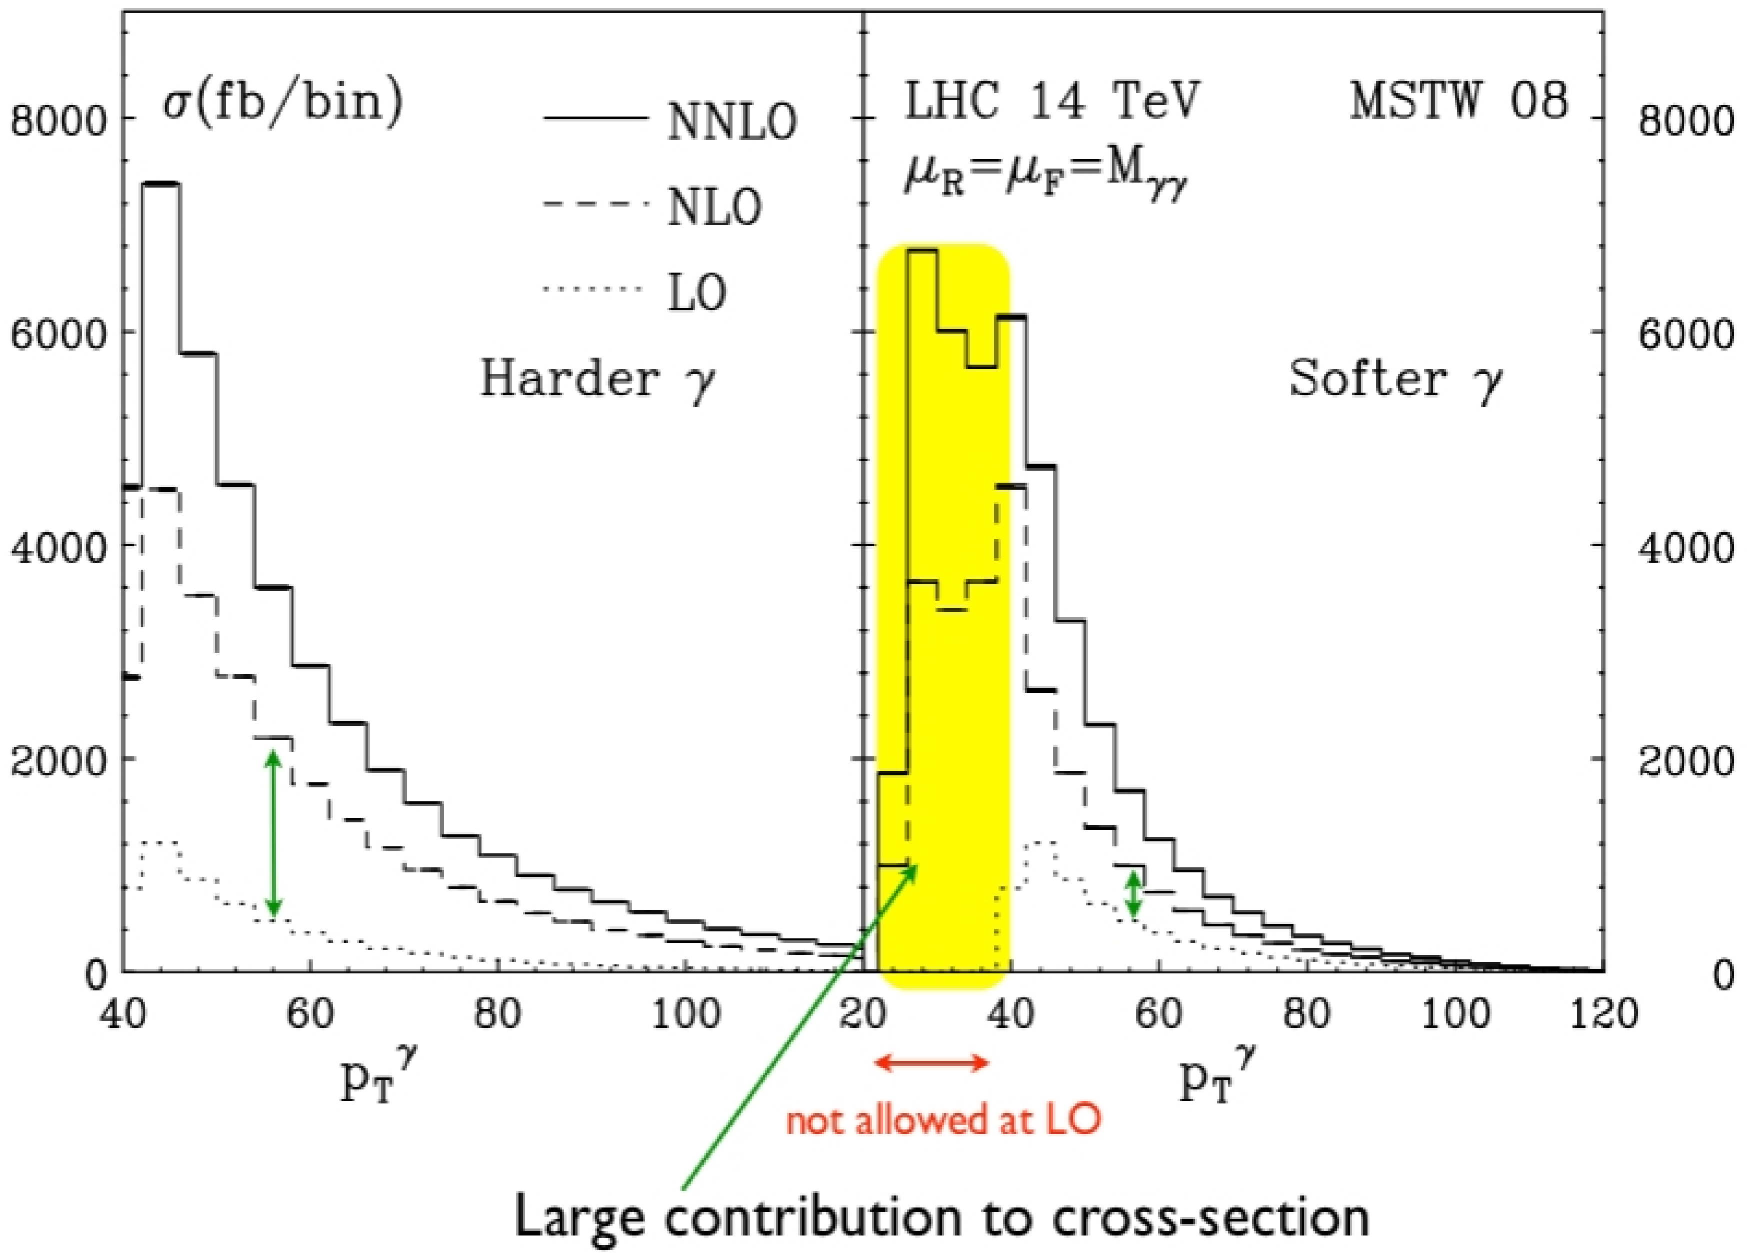
The requirement $p^{\gamma}_{T1} \geq 40$ GeV implies that at LO also the softer photon must have $p^{\gamma}_{T} \geq 40$ GeV

Diphoton production at NNLO

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

First exclusive NNLO with two final state particles

p_T of harder and softer photon



The requirement $p^{\gamma}_{T1} \geq 40$ GeV implies that at LO also the softer photon must have $p^{\gamma}_{T} \geq 40$ GeV

- Substantial contribution from radiation in the region 25 GeV < pT < 40 GeV
- Unphysical peak in $\mathbf{p}^{\gamma}_{T2}$ at $\mathbf{p}^{\gamma}_{T}$ =40 GeV

Diphoton production at NNLO

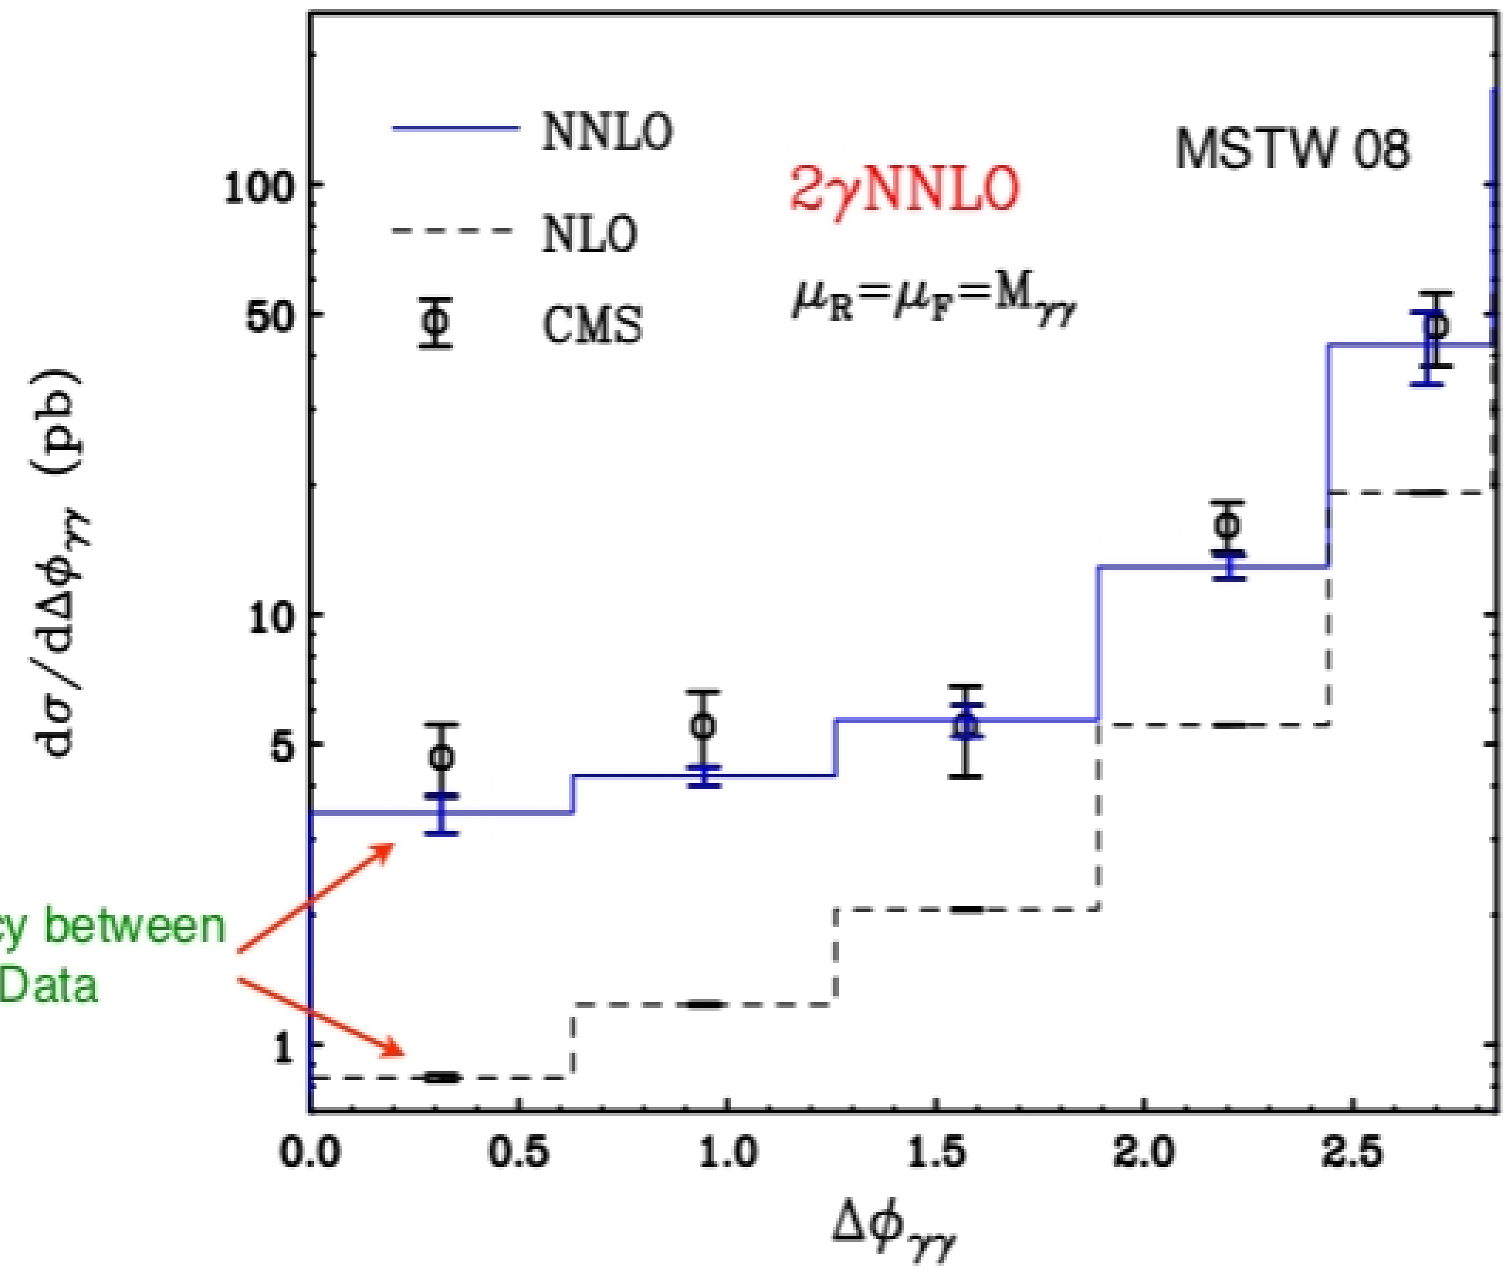
Preliminary results

S.Catani, D. de Florian, G.Ferrera, M.Grazzini, LC

NNLO Corrections much larger in some kinematical regions

NLO effectively lowest order

“away from back-to-back configuration”



$\sqrt{S} = 7$ TeV

CMS diphoton cuts

$p_T^{\gamma\, hard} \geq 23$ GeV

$p_T^{\gamma\, soft} \geq 20$ GeV

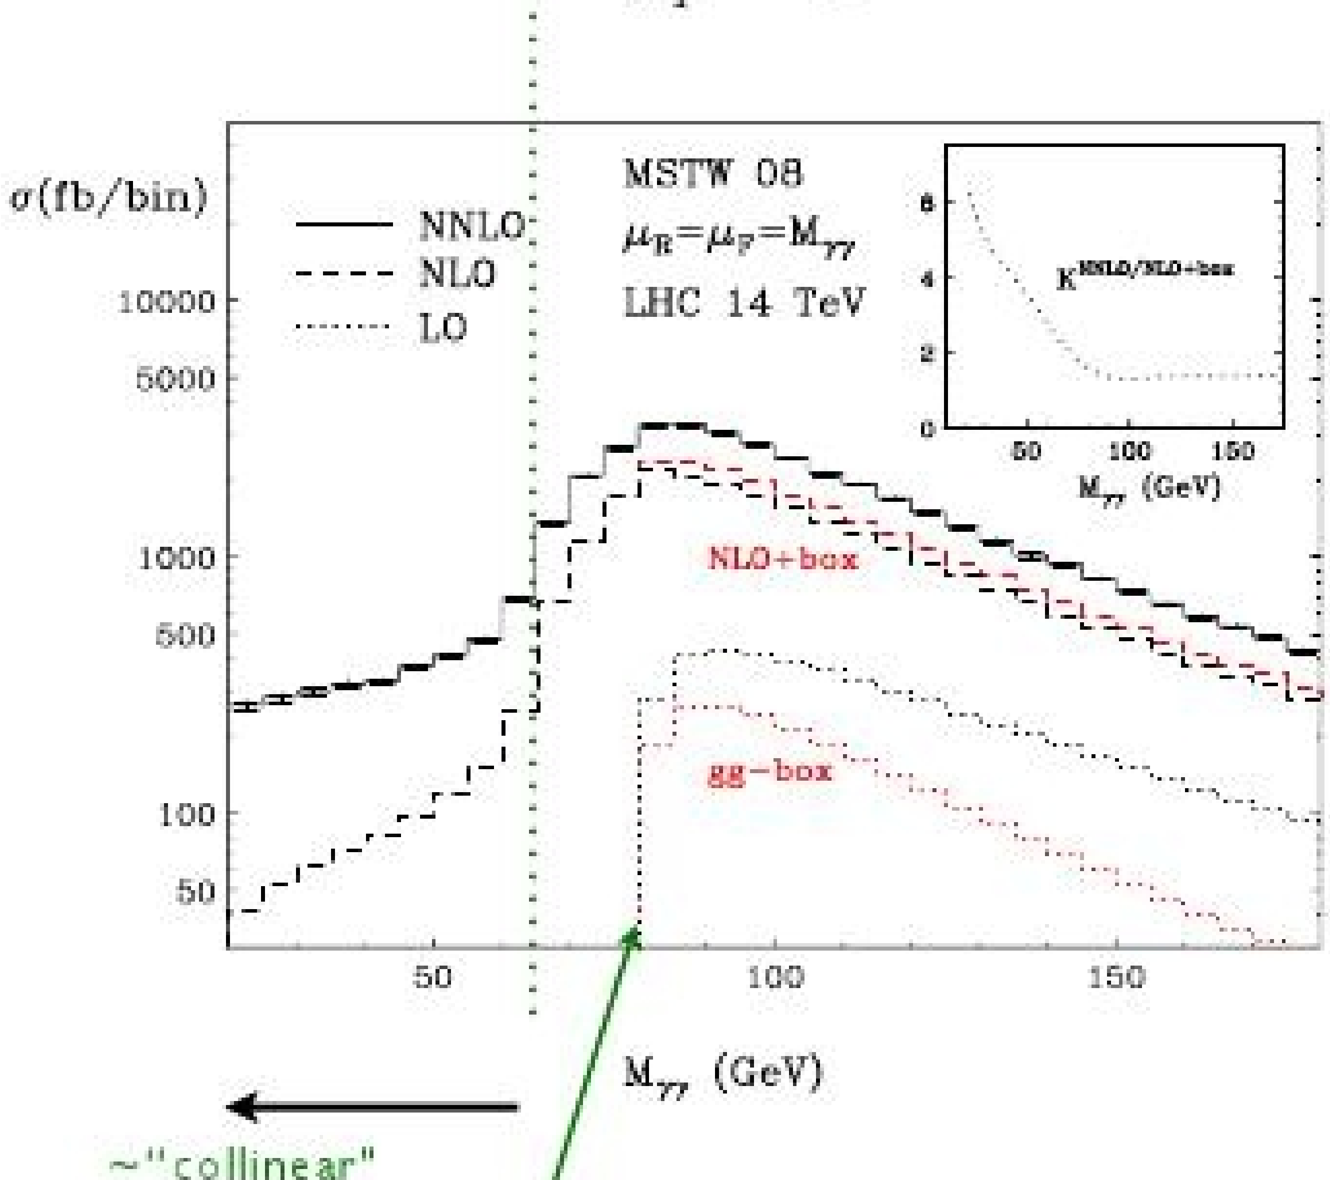
$|\eta^\gamma| \leq 2.5$

$R_{\gamma\gamma} > 0.45$

smooth cone isolation

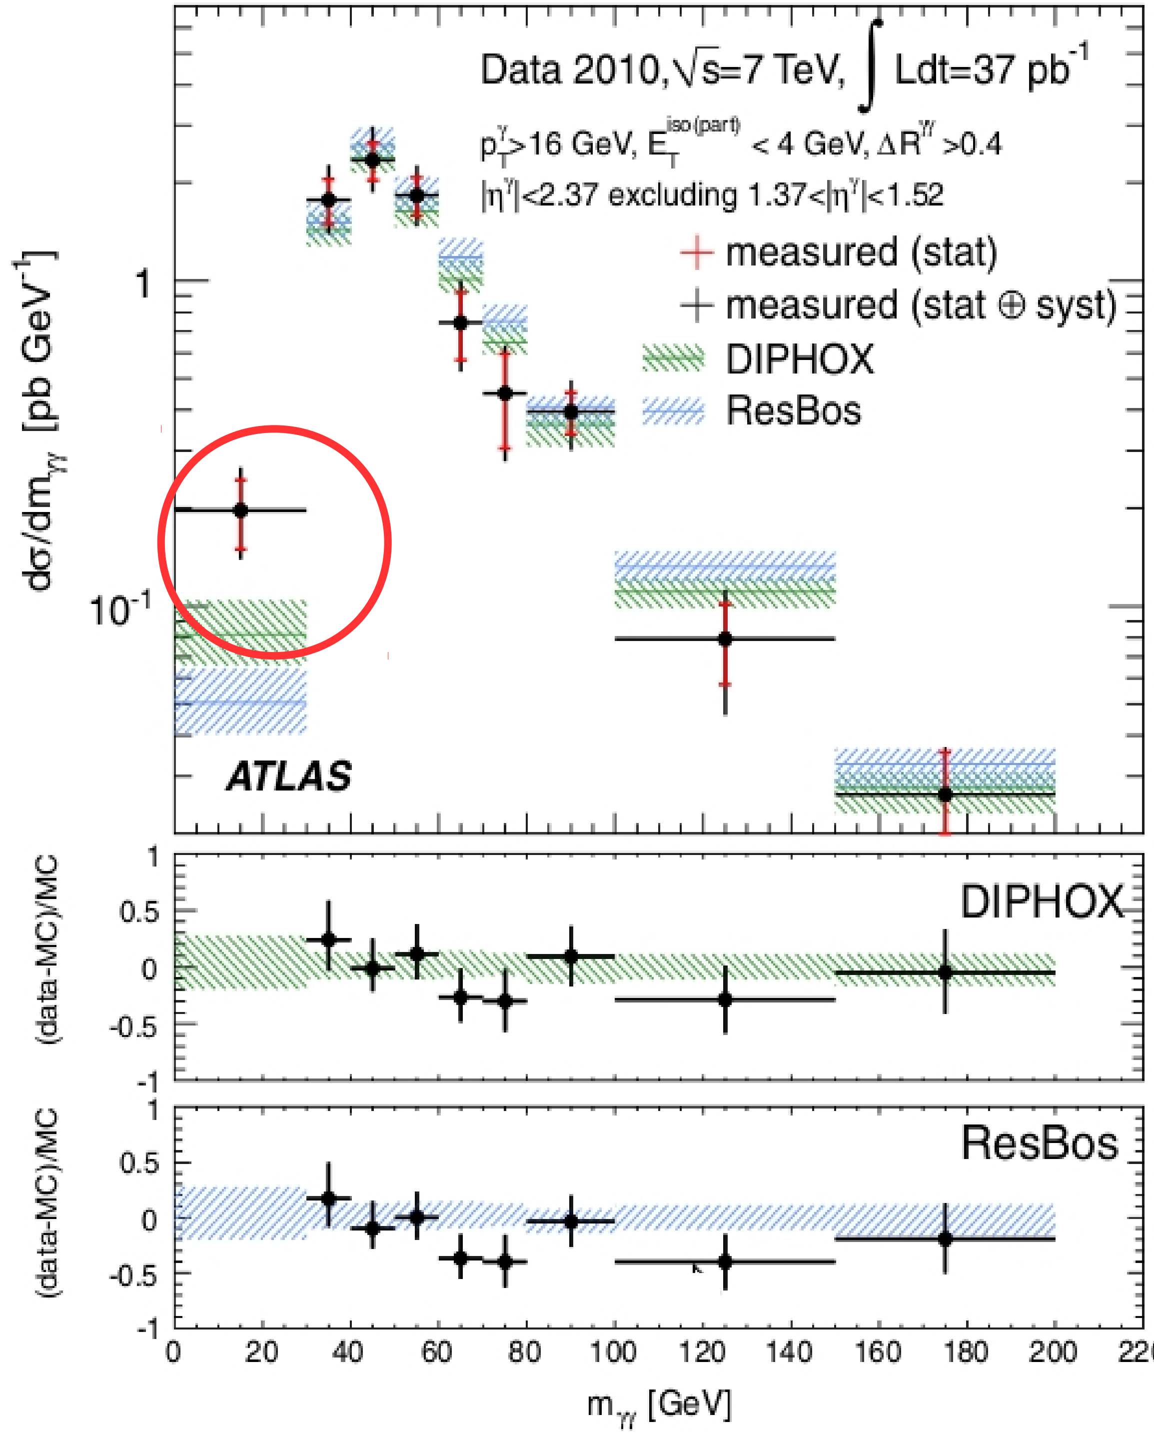
NNLO corrections essential to understand the background invariant mass below the LO threshold

$\sqrt{S} = 14$ TeV $p_T^{\gamma\, hard} \geq 40$ GeV $p_T^{\gamma\, soft} \geq 25$ GeV



LO threshold at 80 GeV

"No back-to-back"



This discrepancy can be related to the discrepancy observed in the $\Delta\phi_{\gamma\gamma}$ distribution.

Summary

- Sizeable NNLO corrections to the γγ mass distribution in kinematical regions related to Higgs boson searches

40-55% effect over NLO

- NNLO very large away from back-to-back configuration (effectively NLO)

needed to understand LHC data

- At NNLO starts to reliably predict values of cross sections in all kinematical regions (with very few exceptions; e.g $p_{T\gamma\gamma} \to 0$)
- Cross section with "smooth" isolation, is a lower bound for cross section with standard isolation.
- Work in progress: release a public version of **2γNNLO**

+ approximation of standard isolation
