Looking forward to new lattice inputs for flavour phenomenology

Tuesday, July 26, 2016 7:00 PM (1 hour)

We review the current status of HQE predictions for neutral meson mixing and related observables. A comparison with most recent data shows a confirmation of the HQE, but also leaves sizeable space for new physics effects. We also point out what improved lattice inputs might be most useful for unambiguously identifying new physics in mixing observables.
