Complex Langevin for Lattice QCD at $T = 0$ and $\mu \geq 0$.

Tuesday, July 26, 2016 4:30 PM (20 minutes)

We simulate Lattice QCD with 2 light quark flavours at zero temperature and finite quark number chemical potential μ . Gauge cooling is applied, along with adaptive rescaling of the updating 'time' increment, to stabilize the algorithm. We see evidence for the expected transition at $\mu \approx m_N/3$ and for saturation at large μ . Limitations of the method are discussed.
