## **Non perturbative renormalization of flavor singlet quark bilinear operators in lattice QCD**

*Wednesday, July 27, 2016 9:20 AM (20 minutes)*

We report on our studies of the renormalization of flavor singlet quark bilinear operators in lattice QCD. The renormalization constants are determined non-perturbatively using gauge field ensembles with  $N_f=2$  dynamical clover improved fermions. The renormalization is performed in the RI-MOM and RI-SMOM schemes. The difference between flavor singlet and non-singlet quark bilinear operators is a disconnected contribution, which has to be evaluated by stochastic estimators. We compare our results with perturbation theory.
