## Critical endline of the finite temperature phase transition for 2+1 flavor QCD around the SU(3)-flavor symmetric point

Monday, 25 July 2016 15:35 (20 minutes)

We investigate the critical endline of the finite temperature phase transition of QCD around the SU(3)-flavor symmetric point at zero chemical potential.

We employ the renormalization-group improved Iwasaki gauge action and non-perturbatively O(a)-improved Wilson-clover fermion action.

The critical endline is determined by using the intersection point of kurtosis, employing the multi-parameter, multi-ensemble reweighting method to calculate observables off the SU(3)-symmetric point, at the temporal size  $N_{\rm T}$ =6 and lattice spacing as low as  $a\approx 0.19$  fm.

We confirm that the slope of the critical endline takes the value of -2, and find that the second derivative is positive, at the SU(3)-flavor symmetric point on the Columbia plot parametrized with the strange quark mass  $m_s$  and degenerated up-down quark mass  $m_l$ .
