## Outline

Introduction

QED correction to meson masses

QED correction to the HVP

## Introduction

- Isospin breaking corrections
- different masses of $\mathbf{u}$ and $\mathbf{d}$ quark
- QED corrections
- expected to be of order of $\mathbf{1 \%}$
- e.g. $\mathbf{a}_{\mu}$, isospin breaking effects crucial to be competitive with determination from $\mathbf{e}^{+} \mathbf{e}^{-} \rightarrow$ hadrons
- QED effects
- stochastic QED using $\mathbf{U ( 1 )}$ gauge configurations [. Harison, Tue 15:0]
- expansion of the path integral in $\boldsymbol{\alpha}_{\text {[RM123 Collaboration, Phys. Rev. D87, } 114505 \text { (2013)] }}$

$$
\langle\mathcal{O}\rangle=\frac{1}{\mathrm{Z}} \int \mathcal{D}[\mathrm{U}] \mathcal{D}[\mathrm{A}] \mathcal{D}[\Psi, \bar{\Psi}] \mathcal{O} \mathrm{e}^{-\mathrm{S}_{\mathrm{F}}[\Psi, \bar{\Psi}, \mathrm{~A}, \mathrm{U}]} \mathrm{e}^{-\mathrm{S}_{\mathrm{A}}[\mathrm{~A}]} \mathrm{e}^{-\mathrm{S}_{\mathrm{G}}[\mathrm{U}]}
$$

$\rightarrow$ compute the leading order QED corrections

## Diagrams at $\mathcal{O}(\alpha)$

- two insertions of the conserved vector current or one insertion of the tadpole operator at $\mathcal{O}(\alpha)$
- three different types of (connected) diagrams

- e.g. photon exchange diagram for a charged Kaon

$$
\mathrm{C}\left(\mathrm{z}_{0}\right)=\sum_{\overrightarrow{\mathrm{z}}} \sum_{\mathrm{x}, \mathrm{y}} \operatorname{Tr}\left[\mathbf{S}^{\mathrm{s}}(\mathrm{z}, \mathrm{x}) \Gamma_{\nu}^{\mathrm{c}} \mathbf{S}^{\mathrm{s}}(\mathrm{x}, \mathbf{0}) \gamma_{5} \mathbf{S}^{\mathrm{u}}(\mathbf{0}, \mathrm{y}) \Gamma_{\mu}^{\mathrm{c}} \mathbf{S}^{\mathrm{u}}(\mathrm{y}, \mathrm{z}) \gamma_{5}\right] \boldsymbol{\Delta}_{\mu \nu}(\mathrm{x}-\mathrm{y})
$$

## photon propagator

- photon propagator (Feynman gauge)

$$
\Delta_{\mu \nu}(\mathrm{x}-\mathrm{y})=\delta_{\mu \nu} \frac{1}{\mathrm{~V}} \sum_{\mathrm{k}, \overrightarrow{\mathrm{k}} \neq 0} \frac{\mathrm{e}^{\mathrm{ik} \cdot(\mathrm{x}-\mathrm{y})}}{4 \sum_{\rho} \sin ^{2} \frac{\mathrm{k}_{\rho}}{2}}
$$

- subtract all spatial zero modes $\rightarrow$ QED $_{\text {L [Borsany iet al., Science 347 (2015) 1452-145]] }}$
- rewrite photon propagator

$$
\Delta_{\mu \nu}(\mathrm{x}-\mathrm{y}) \approx \sum_{\mathrm{u}} \Delta_{\mu \nu}(\mathrm{x}-\mathrm{u}) \eta(\mathrm{u}) \eta^{\dagger}(\mathrm{y})=\tilde{\Delta}_{\mu \nu}(\mathrm{x}) \eta^{\dagger}(\mathrm{y})
$$

with a stochastic source (e.g. $\mathbf{Z}_{2}$ )

$$
\frac{1}{\mathrm{~N}} \sum_{\mathrm{i}=1}^{\mathrm{N}} \eta_{\mathrm{i}}(\mathrm{u}) \eta_{\mathrm{i}}^{\dagger}(\mathrm{y}) \approx \delta_{\mathrm{u}, \mathrm{y}}
$$

- calculate $\tilde{\mathbf{\Delta}}_{\mu \nu}(\mathbf{x})=\sum_{\mathbf{u}} \Delta_{\mu \nu}(\mathbf{x}-\mathbf{u}) \eta(\mathbf{u})$ using Fast Fourier Transform

## construction of the correlators

- photon exchange for a charged Kaon

$$
\mathbf{C}\left(\mathrm{z}_{0}\right)=\sum_{\overrightarrow{\mathrm{z}}} \sum_{\mathrm{x}, \mathrm{y}} \operatorname{Tr}\left[\mathbf{S}^{\mathrm{s}}(\mathrm{z}, \mathrm{x}) \Gamma_{\nu}^{\mathrm{c}} \mathbf{S}^{\mathrm{s}}(\mathrm{x}, \mathbf{0}) \gamma_{5} \mathbf{S}^{\mathrm{u}}(\mathbf{0}, \mathrm{y}) \Gamma_{\mu}^{\mathrm{c}} \mathbf{S}^{\mathrm{u}}(\mathrm{y}, \mathrm{z}) \gamma_{5}\right] \tilde{\mathbf{\Delta}}_{\mu \nu}(\mathrm{x}) \eta^{\dagger}(\mathrm{y})
$$

- sequential propagators

- contraction

- similar for the self energy using a double sequential propagator

## setup of the run

- $\mathrm{N}_{\mathrm{f}}=2+1$ Domain Wall Fermions
- $64 \times 24^{3}$ lattice with $\mathrm{a}^{-1}=1.78 \mathrm{GeV}$
- $\mathrm{L}_{\mathrm{s}}=16, \mathrm{M}_{5}=1.8$
- 87 gauge configurations
- pion mass $\mathbf{m}_{\boldsymbol{\pi}}=\mathbf{3 4 0} \mathrm{Mev}$
- different masses for valence $\mathbf{u}$ and $\mathbf{d}$ quarks
$\approx$ physical mass difference [BMw Collaboration, 1604.07112]
- physical valence strange quark mass [T. Bume etal, Phys. Rev. D93, 074505 (2016)]
- one $\mathbf{Z}_{2}$ noise for the stochastic insertion of the photon propagator per gauge configuration and source position
- 3 source positions
- computational cost:

17 inversions per valence quark and source position

## results - correlators

- two quarks with $\mathbf{m}_{\mathbf{u}}$
- photon exchange

- self energy

- tadpole

## corrections to meson masses

- extract mass correction from an $\mathcal{O}(\boldsymbol{\alpha})$ diagram by
[RM123 Collaboration, Phys.Rev. D87, 114505 (2013)]

$$
\mathrm{C}(\mathrm{t})=\mathrm{C}_{2 \mathrm{pt}}(\mathrm{t})+\mathrm{C}_{\mathcal{O}(\alpha)}(\mathrm{t})=\mathrm{Ae}^{-(\mathrm{m}+\delta \mathrm{m}) \cdot \mathrm{t}} \Rightarrow \delta \mathrm{~m}=-\partial_{\mathrm{t}} \frac{\mathrm{C}_{\mathcal{O}(\alpha)}(\mathrm{t})}{\mathrm{C}_{2 \mathrm{pt}}(\mathrm{t})}
$$

- photon exchange

- example: charged Kaon

## results QED corrections to meson masses

- some (very preliminary) results for QED corrections to meson masses (w/o finite volume correction)

| Quantity | this work | stochastic QED ${ }_{[\text {Tue, } 15: 00]}$ |
| :---: | :---: | :---: |
| $\mathbf{M}_{\boldsymbol{\pi}^{+}}^{\gamma}$ | $\mathbf{2 . 7 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ | $\mathbf{3 . 4 2} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ |
| $\mathbf{M}_{\boldsymbol{\pi}^{0}}^{\gamma}$ | $\mathbf{0 . 7 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ | $\mathbf{1 . 5 2} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ |
| $\mathbf{M}_{\boldsymbol{\pi}^{+}} \mathbf{M}_{\boldsymbol{\pi}^{0}}$ | $2.00 \pm \mathbf{0 . 0 3} \mathrm{MeV}$ | $\mathbf{1 . 9 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ |
| $\mathbf{M}_{\mathbf{K}^{+}}^{\gamma}$ | $\mathbf{2 . 1 2} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ | $\mathbf{2 . 7 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ |
| $\mathbf{M}_{\mathbf{K}^{0}}^{\gamma}$ | $\mathbf{0 . 2 8} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ | $\mathbf{0 . 5 5} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ |

## results QED corrections to meson masses

- some (very preliminary) results for QED corrections to meson masses (w/o finite volume correction)

| Quantity | this work | stochastic QED ${ }_{[\text {Tue, } 15: 00]}$ |
| :---: | :---: | :---: |
| $\mathbf{M}_{\boldsymbol{\pi}^{+}}^{\gamma}$ | $\mathbf{2 . 7 0} \pm \mathbf{0 . 0 2 ~ M e V}$ | $\mathbf{3 . 4 2} \pm \mathbf{0 . 0 2 ~ M e V}$ |
| $\mathbf{M}_{\boldsymbol{\pi}^{0}}^{\gamma}$ | $\mathbf{0 . 7 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ | $\mathbf{1 . 5 2} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ |
| $\mathbf{M}_{\boldsymbol{\pi}^{+}} \mathbf{M}_{\boldsymbol{\pi}^{0}}$ | $2.00 \pm \mathbf{0 . 0 3} \mathrm{MeV}$ | $1.90 \pm \mathbf{0 . 0 2} \mathrm{MeV}$ |
| $\mathbf{M}_{\mathbf{K}^{+}}^{\gamma}$ | $\mathbf{2 . 1 2} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ | $\mathbf{2 . 7 0} \pm \mathbf{0 . 0 2} \mathrm{MeV}$ |
| $\mathbf{M}_{\mathbf{K}^{0}}^{\gamma}$ | $\mathbf{0 . 2 8} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ | $\mathbf{0 . 5 5} \pm \mathbf{0 . 0 1} \mathrm{MeV}$ |

- pion mass splitting is a special case [RM123 Collaboration, Phys.Rev. D87, 114505 (2013)] $\rightarrow$ depends only on photon exchange diagram

$$
M_{\pi^{+}}-M_{\pi^{0}}=\frac{\left(q_{u}-q_{d}\right)^{2}}{2} e^{2} \partial_{t} \frac{C_{e x c h}(\mathbf{t})}{C_{2 \mathrm{pt}}(\mathbf{t})}
$$

- problem in the self energy and/or the tadpole diagram?
$\rightarrow$ needs to be resolved

## Comparison of statistical precision

- computational cost
- perturbative method 17 inversions per quark flavor
- stochastic method 3 inversions per quark flavor
- statistical error $\boldsymbol{\Delta}$ of QED contribution to effective Kaon mass
- scaled by $\sqrt{\# \text { inversions }}$

## The hadronic vacuum polarisation

- vacuum polarisation tensor

$$
\boldsymbol{\Pi}_{\mu \nu}(\mathbf{Q})=\sum_{\mathrm{x}} \mathrm{e}^{\mathrm{i} \mathbf{Q} \cdot \mathrm{x}}\left\langle\mathrm{j}_{\mu}^{\gamma}(\mathrm{x}) \mathrm{j}_{\nu}^{\gamma}(\mathbf{0})\right\rangle=\left(\mathbf{Q}_{\mu} \mathbf{Q}_{\nu}-\delta_{\mu \nu} \mathbf{Q}^{2}\right) \boldsymbol{\Pi}\left(\mathbf{Q}^{2}\right)
$$

- correlator

$$
\mathbf{C}_{\mu \nu}(\mathrm{x})=\mathbf{Z}_{\mathrm{v}} \mathbf{q}_{\mathrm{f}}^{2}\left\langle\mathbf{V}_{\mu}^{\mathrm{c}}(\mathrm{x}) \mathbf{V}_{\nu}^{\ell}(0)\right\rangle
$$

- construction of the HVP tensor, see eg. [RBC/UKQcD, JHEP 1604 (2016) 063]. [M. Spragss, Tue 17:10]

$$
\boldsymbol{\Pi}_{\mu \nu}(\mathbf{Q})=\sum_{\mathrm{x}} \mathrm{e}^{-\mathrm{i} \cdot \times \mathrm{x}} \mathbf{C}_{\mu \nu}(\mathrm{x})-\sum_{\mathrm{x}} \mathbf{C}_{\mu \nu}(\mathrm{x})
$$

(with zero mode subtraction)

- vacuum polarisation

$$
\begin{gathered}
\Pi\left(\hat{Q}^{2}\right)=\frac{1}{3} \sum_{j} \frac{\Pi_{\mathrm{jj}}(Q)}{\hat{Q}^{2}} \\
\Pi\left(\hat{Q}^{2}\right) \equiv \frac{4}{9} \Pi^{u}\left(\hat{Q}^{2}\right)+\frac{1}{9} \Pi^{d}\left(\hat{Q}^{2}\right)+\frac{1}{9} \Pi^{s}\left(\hat{Q}^{2}\right)
\end{gathered}
$$

## First look at HVP

- hadronic vacuum polarisation for the u quark
- left: HVP without QED $\Pi_{0}^{u}\left(\hat{\mathbf{Q}}^{2}\right)$, right: QED corrections to HVP $\delta \Pi^{u}\left(\hat{\mathbf{Q}}^{2}\right)$

$$
\Pi^{u}\left(\hat{\mathbf{Q}}^{2}\right)=\Pi_{0}^{u}\left(\hat{\mathbf{Q}}^{2}\right)+\delta \Pi^{u}\left(\hat{\mathbf{Q}}^{2}\right)
$$

## Summary

- Leading order QED corrections by expansion of the path integral
- corrections to meson masses and HVP
- exploratory study
- currently, discrepancy between results from stochastic and perturbative approach
$\rightarrow$ needs to be resolved

## Outlook

- Coulomb gauge for the photon propagator
- more gauge ensembles
- matrix elements [N. Carraso et tl, Phys. Rev. D91 (2015) 074506], [N. Tantalo, Wed 11:50], [S. Simula, Wed 12:10]

## Backup

## expansion of the Wilson-Dirac operator in $\mathbf{e}$

- Including QED link variables the action is

$$
\begin{aligned}
\mathrm{S}_{\mathrm{W}}^{\mathrm{e}}=\sum_{\mathrm{x}}[ & \bar{\Psi}(\mathrm{x})(\mathrm{M}+4) \Psi(\mathrm{x})-\frac{1}{2} \bar{\Psi}(\mathrm{x})\left(1-\gamma_{\mu}\right) \mathrm{E}_{\mu}(\mathrm{x}) \mathrm{U}_{\mu}(\mathrm{x}) \Psi(\mathrm{x}+\mu) \\
& \left.-\frac{1}{2} \bar{\Psi}(\mathrm{x}+\mu)\left(1-\gamma_{\mu}\right) \mathrm{U}_{\mu}^{\dagger}(\mathrm{x}) \mathrm{E}_{\mu}^{\dagger}(\mathrm{x}) \Psi(\mathrm{x})\right]
\end{aligned}
$$

with QED link variables

$$
E_{\mu}(x)=e^{-i e e_{f} A_{\mu}(x)}=1-i e e_{f} A_{\mu}(x)+\frac{1}{2}\left(e e_{f}\right)^{2} A_{\mu}(x) A_{\mu}(x)+\ldots
$$

- Expanding the action in $\mathbf{e}$ one finds

$$
\mathbf{S}_{\mathrm{w}}^{e}-\mathbf{S}_{\mathrm{W}}^{0}=\sum_{\mathrm{x}, \mu}\left\{-\mathrm{iee}_{\mathrm{f}} \mathbf{A}_{\mu}(\mathrm{x}) \mathbf{V}_{\mu}^{\mathrm{c}}(\mathrm{x})+\frac{\left(\mathrm{ee}_{\mathrm{f}}\right)^{2}}{2} \mathbf{A}_{\mu}(\mathrm{x}) \mathbf{A}_{\mu}(\mathrm{x}) \mathbf{T}_{\mu}(\mathrm{x})\right\}
$$

with the conserved vector current $\mathbf{V}_{\mu}^{\mathbf{c}}(\mathbf{x})$ and the tadpole operator $\mathbf{T}_{\mu}(\mathbf{x})$

$$
\begin{aligned}
& \mathbf{V}_{\mu}^{\mathrm{c}}(\mathrm{x})=\frac{1}{2}\left[\bar{\Psi}(\mathrm{x}+\mu)\left(1+\gamma_{\mu}\right) \mathrm{U}_{\mu}^{\dagger}(\mathrm{x}) \Psi(\mathrm{x})-\bar{\Psi}(\mathrm{x})\left(1-\gamma_{\mu}\right) \mathrm{U}_{\mu}(\mathrm{x}) \Psi(\mathrm{x}+\mu)\right] \\
& \mathrm{T}_{\mu}(\mathrm{x})=\frac{1}{2}\left[\bar{\Psi}(\mathrm{x})\left(1-\gamma_{\mu}\right) \mathrm{U}_{\mu}(\mathrm{x}) \Psi(\mathrm{x}+\mu)+\overline{\boldsymbol{\Psi}}(\mathrm{x}+\mu)\left(1+\gamma_{\mu}\right) \mathrm{U}_{\mu}^{\dagger}(\mathrm{x}) \Psi(\mathrm{x})\right]
\end{aligned}
$$

## photon propagator with FFT

- $\tilde{\Delta}_{\mu \nu}(\mathrm{x})=\sum_{\mathrm{u}} \Delta_{\mu \nu}(\mathrm{x}-\mathrm{u}) \eta(\mathrm{u})$ with $\Delta_{\mu \nu}(\mathrm{x}-\mathrm{y})=\delta_{\mu \nu} \frac{1}{\mathrm{~V}} \sum_{\mathrm{k}, \overrightarrow{\mathrm{k}} \neq 0} \frac{\mathrm{e}^{\mathrm{ik} \cdot(\mathrm{x}-\mathrm{y})}}{\hat{\mathrm{k}}^{2}}$
- Fourier Transform of the stochastic source

$$
\eta(\mathrm{u}) \xrightarrow{\mathrm{FFT}} \hat{\eta}(\mathrm{k})
$$

- divide by $\hat{\mathbf{k}}^{2}$ and subtract the zero mode

$$
\left.\frac{\hat{\eta}(\mathbf{k})}{\hat{\mathbf{k}}^{2}} \longrightarrow \frac{\hat{\eta}(\mathbf{k})}{\hat{\mathbf{k}}^{2}}\right|_{\overrightarrow{\mathbf{k}}=0}=0
$$

- Fourier Transform

$$
\xrightarrow{\mathrm{FFT}} \quad \tilde{\Delta}(\mathrm{x})=\sum_{\mathrm{k}, \overrightarrow{\mathrm{k}} \neq 0} \frac{\hat{\eta}(\mathrm{k})}{\hat{\mathrm{k}}^{2}} \mathrm{e}^{\mathrm{ik} \cdot \mathrm{x}}=\sum_{\mathrm{u}} \Delta(\mathrm{x}-\mathbf{u}) \eta(\mathrm{u})
$$
