

# Estimation for 2 dimensional free fermion negativity

*Thursday, 14 January 2016 16:40 (25 minutes)*

Quantum entanglement has played an increasingly important role in string theory. In this presentation, I will talk about negativity, a measure of entanglement for tripartite systems. In particular, the negativity of a 2 dimensional free fermion, which is still an open question. I will discuss the main difficulty and current knowledge of the free fermion negativity and introduce a path integral which is a convenient tool to help us study the feature of negativity.
