- EXPLAINED BY INSUFFICIENTLY FLEXIBLE PDF PARAMETRIZATION $\Rightarrow$ FIXED IN MSTW08DEUT/MMHT

WHY DO SOME PDF SETS DISAGREE?
FFN PDFs

- SOME PDF SETS ADOPT A FFN SCHEME (ABM, JR)
- ABM ALSO INCLUDES HIGHER TWIST & NUCLEAR CORRECTIONS
- ALSO, ABM MOSTLY BASED ON DIS DATA
- NNPDF WITH FFN &DIS DATA SET AGREES WITH ABM;
  HIGHER TWIST & NUCLEAR CORRRECTIONS HAVE SMALL & LOCALIZED EFFECT;
- FFN EVOLUTION WEAKER $\Rightarrow$ GLUON DISTORTED analytic argument by R.Thorne, 2012

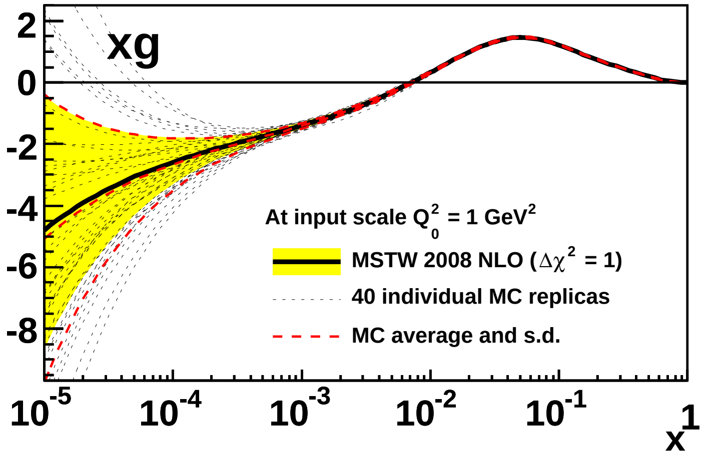
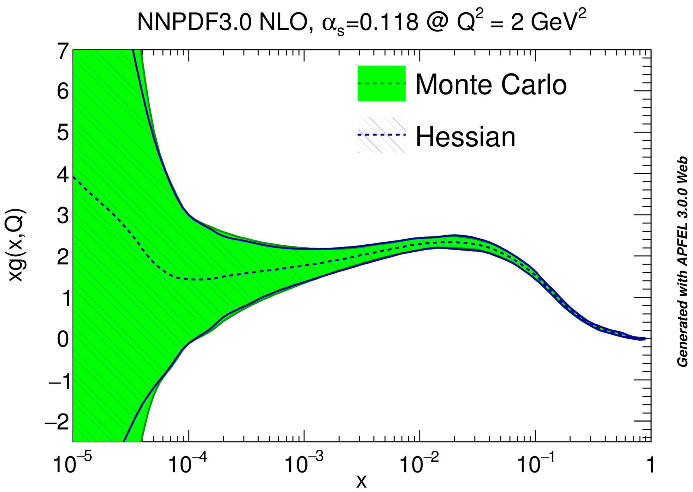
MC ⇔ HESSIAN

- TO CONVERT HESSIAN INTO MONTECARLO GENERATE MULTIGAUSSIAN REPLICAS IN PARAMETER SPACE
- ACCURATE WHEN NUMBER OF REPLICAS SIMILAR TO THAT WHICH REPRODUCES DATA



(Thorne, Watt, 2012)

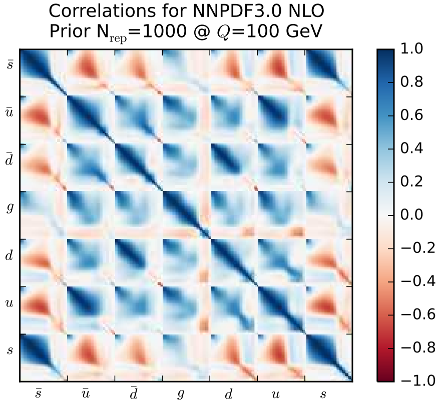


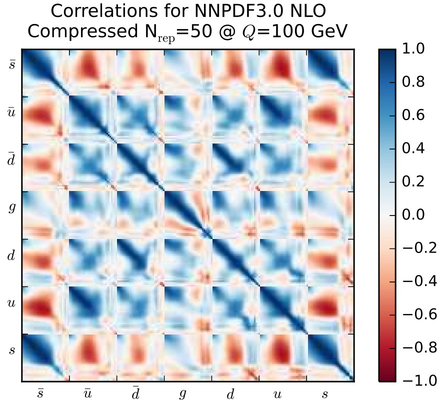
(Carrazza, SF, Kassabov, Rojo, 2015)

- TO CONVERT MONTE CARLO INTO HESSIAN, SAMPLE THE REPLICAS $f_i(x)$ AT A DISCRETE SET OF POINTS & CONSTRUCT THE ENSUING COVARIANCE MATRIX
- EIGENVECTORS OF THE COVARIANCE MATRIX AS A BASIS IN THE VECTOR SPACE SPANNED BY THE REPLICAS BY SINGULAR-VALUE DECOMPOSITION
- NUMBER OF DOMINANT EIGENVECTORS SIMILAR TO NUMBER OF REPLICAS ⇒ ACCURATE REPRESENTATION

COMPRESSION

MONTECARLO





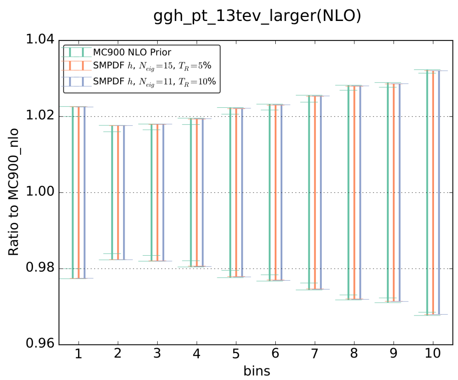
(Carrazza, Latorre, Kassabov, Rojo, 2015)

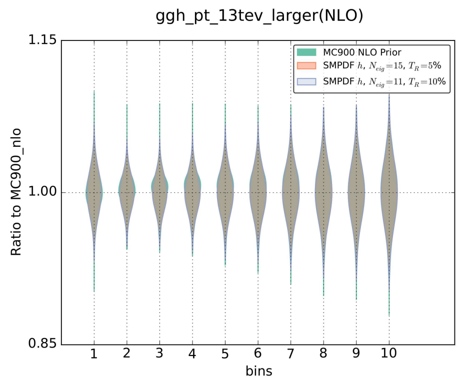
- CONSTRUCT A VERY LARGE REPLICA SAMPLE
- SELECT (BY GENETIC ALGORITHM) A SUBSET OF REPLICAS WHOSE STATISTICAL FEATURES ARE AS CLOSE AS POSSIBLE TO THOSE OF THE PRIOR
- $\Rightarrow$ FOR ALL PDFs ON A GRID OF POINTS// MINIMIZE DIFFERENCE OF: FIRST FOUR MOMENTS, CORRELATIONS; OUTPUT OF KOLMOGOROV-SMIRNOV TEST (NUMBER OF REPLICAS BETWEEN MEAN AND σ, 2σ, INFINITY)
- 50 COMPRESSED REPLICA REPRODUCE 1000 REPLICA SET TO PRECENT ACCURACY

CAN REPRODUCE NONGAUSSIAN FEATURES WITH REASONABLY SMALL REPLICA SAMPLE

HESSIAN

- SELECT SUBSET OF THE COVARIANCE MATRIX CORRELATED TO A GIVEN SET OF PROCESSES
- PERFORM SVD ON THE REDUCED COVARIANCE MATRIX, SELECT DOMINANT EIGENVECTOR, PROJECT OUT ORTHOGONAL SUBSPACE
- ITERATE UNTIL DESIRED ACCURACY REACHED
- CAN ADD PROCESSES TO GIVEN SET; CAN COMBINE DIFFERENT OPTIMIZED SETS
- 15 EIGENVECTORS DESCRIBE ALL HIGGS MODES + JETS + W, Z PRODUCTION





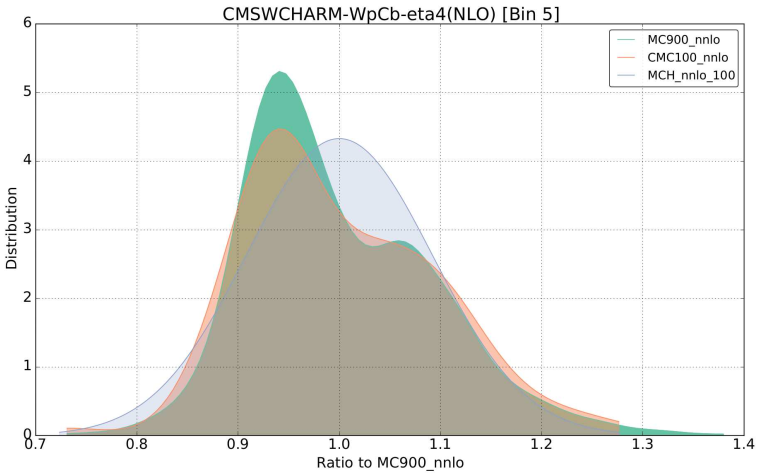
(Carrazza, SF, Kassabov, Rojo, 2016)

VERY SMALL NUMBER OF EVECS; CAN COMBINE WITH NUISANCE PARMS

NONGAUSSIAN BEHAVIOUR

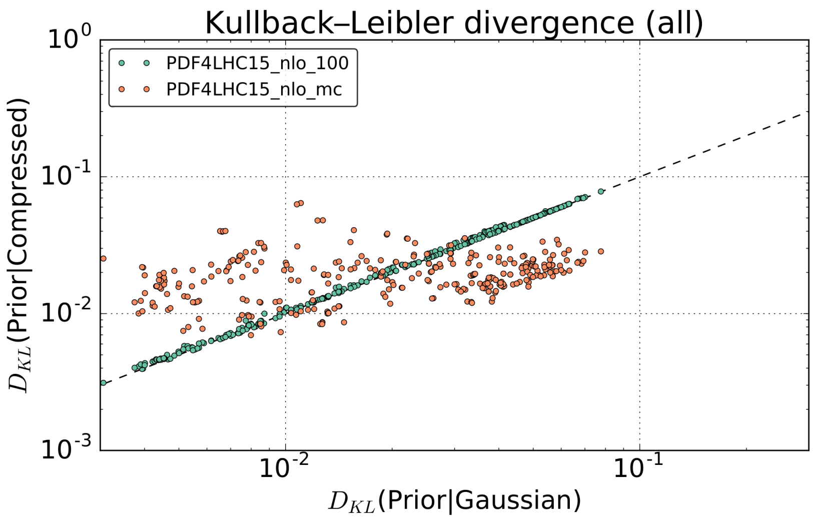
MONTE CARLO COMPARED TO HESSIAN

CMS $W + c$ production



- DEVIATION FROM GAUSSIANITY E.G. AT LARGE x DUES TO LARGE UNCERTAINTY + POSITIVITY BOUNS $\Rightarrow$ RELEVANT FOR SEARCHES
- CANNOT BE REPRODUCED IN HESSIAN FRAMEWORK
- WELL REPRODUCED BY COMPRESSED MC

- DEFINE KULLBACK-LEIBLER DIVERGENCE $D_{\rm KL} = \int_{-\infty}^{\infty} P(x) \frac{\ln P(x)}{\ln Q(x)}\, dx$ BETWEEN A PRIOR P AND ITS REPRESENTATION Q
- $D_{\rm KL}$ BETWEEN PRIOR AND HESSIAN DEPENDS ON DEGREE OF GAUSSIANITY
- $D_{\rm KL}$ BETWEEN PRIOR AND COMPRESSED MC DOES NOT



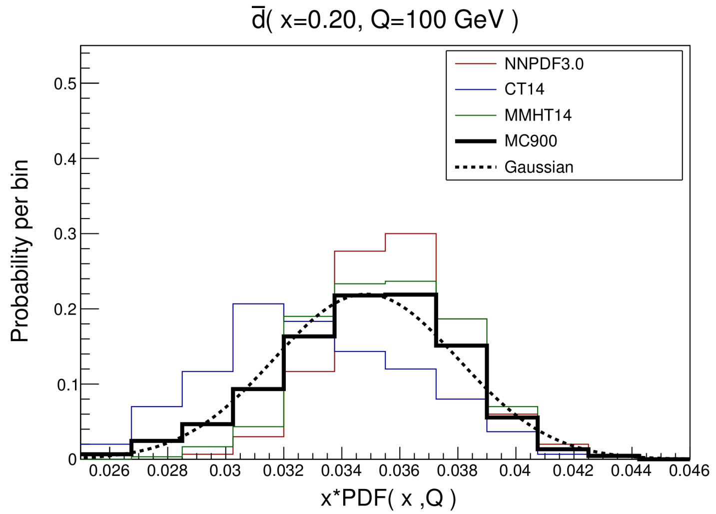
CAN GAUGE WHEN MC IS MORE ADVANTAGEOUS THAN HESSIAN!

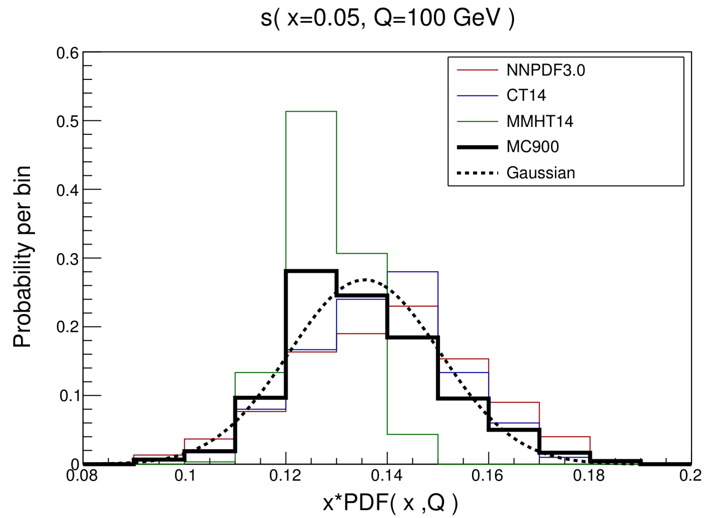
MONTE CARLO COMBINATION

(Watt, S.F., 2010-2013)

- may combine different PDF sets, after MC conversion of Hessian sets
- combine Monte Carlo replicas into single set
- combined set approximately gaussian

combined PDF4LHC sets for antidown & strange





PDF4LHC15 COMBINATION

- INCLUDES CT14, MMHT, NNPDF3.0
- 900 REPLICAS (300 FOR EACH SET) ENSURE PRECENTAGE ACCURACY ON ALL QUANTITIES

300, 900,1800 REPLICAS

OLD PROBLEMS

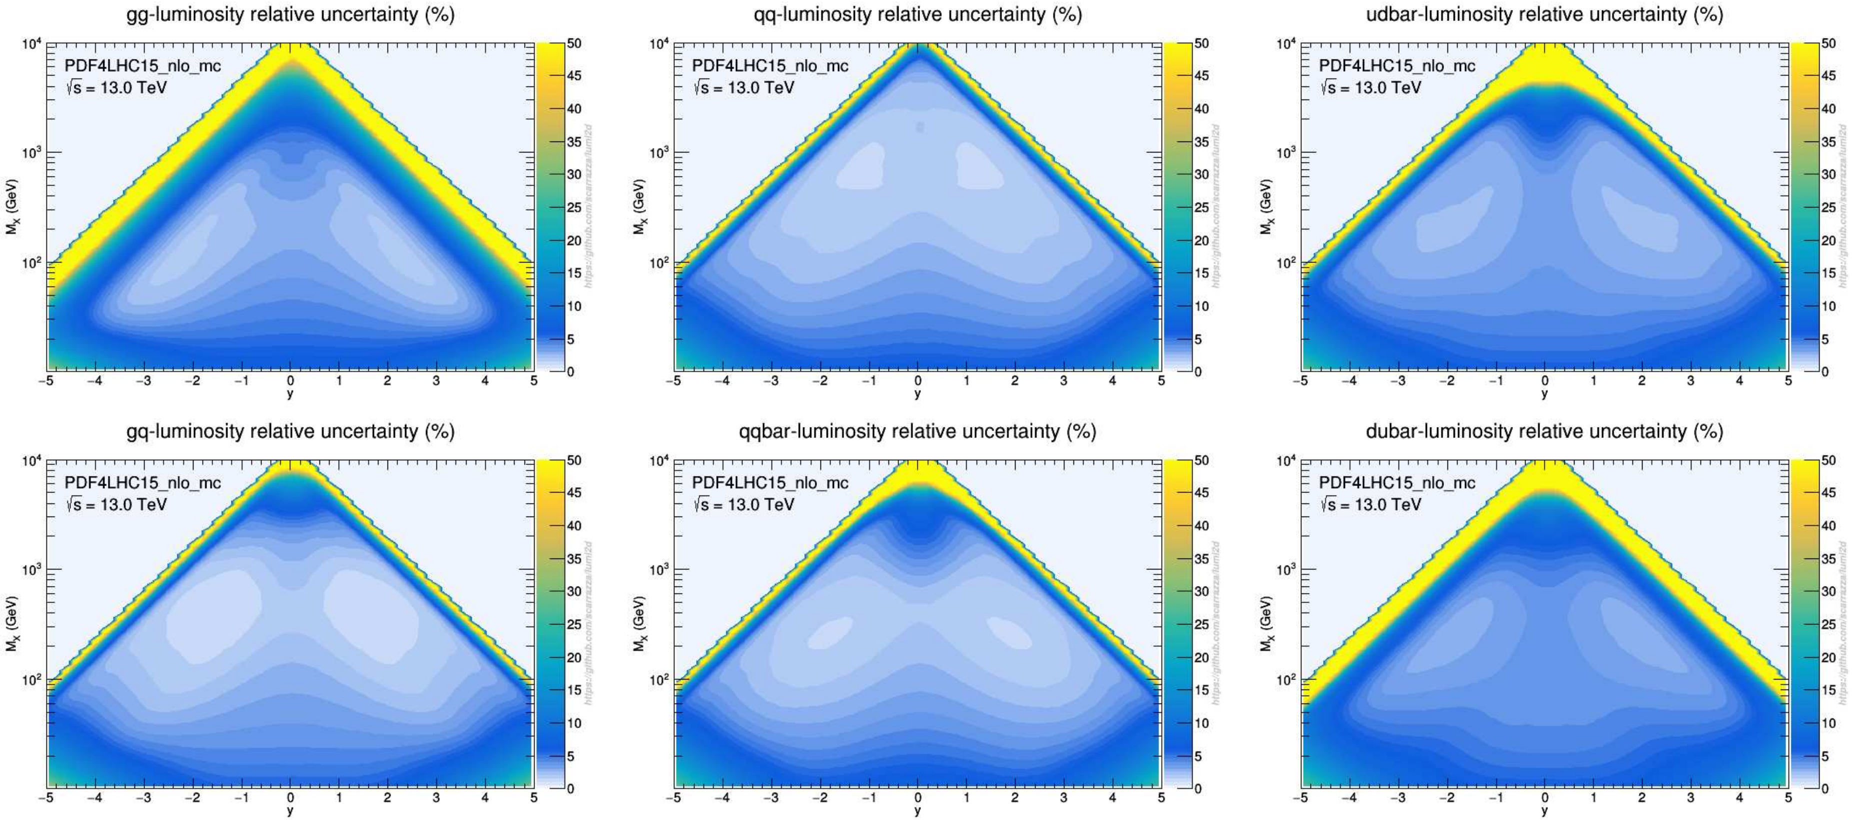
LESSONS LEARNT

- THE RELIABILITY OF PDF SETS CRUCIALLY DEPENDS ON THE INCLUSION OF A WIDE ENOUGH DATASET
- FFN PDFS UNRELIABLE
- CAN FREELY CHOOSE MC OR HESSIAN PDF UNCERTAINTIES:
  - MC ALLOWS REPRODUCING NON-GAUSSIAN BEHAVIOUR
  - HESSIAN ALLOWS FOR OPTIMAL ACCURATE REPRESENTATION OF GAUSSIAN UNCERTAINTIES
  - COMPRESSION METHODS AVAILABLE IN BOTH CASES

OPEN PROBLEMS

PDF UNCERTAINTIES: THE STATE OF THE ART
(PDF4LHC15, NLO)

GLUON SINGLET FLAVORS



- GLUON BETTER KNOWN AT SMALL x, VALENCE QUARKS AT LARGE x, SEA QUARKS IN BETWEEN
- SWEET SPOT: VALENCE Q - G; UNCERTAINTIES DOWN TO 1%
- UP BETTER KNOWN THAN DOWN; FLAVOR SINGLET BETTER THAN INDIVIDUAL FLAVORS

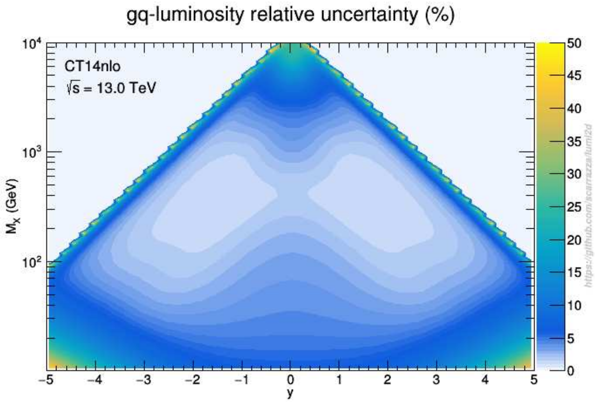
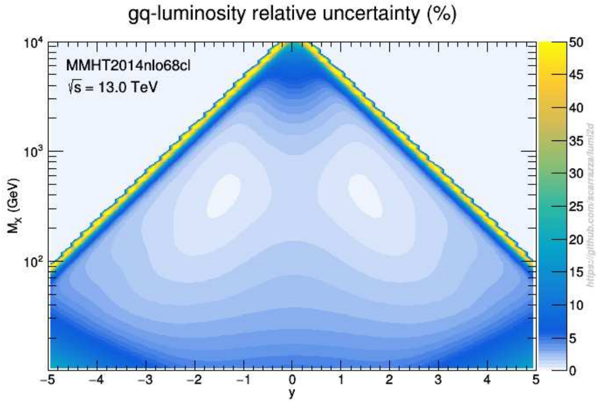
CAN WE BELIEVE IN 1% PDF UNCERTAINTIES?

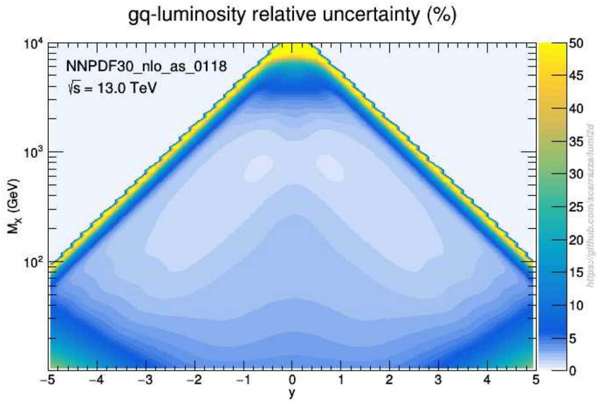
WHAT'S THE UNCERTAINTY ON THE PDF UNCERTAINTY?

qg

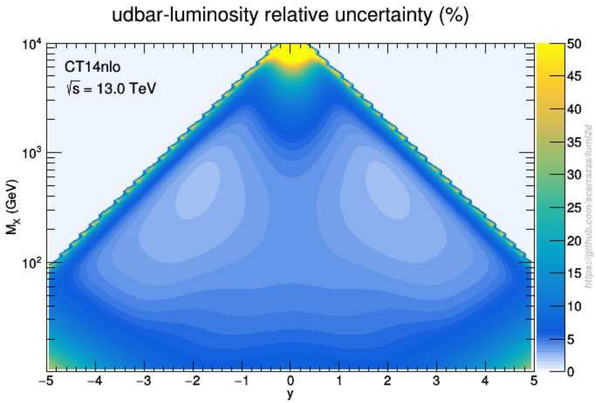
CT14 | MMHT | NNPDF3.0

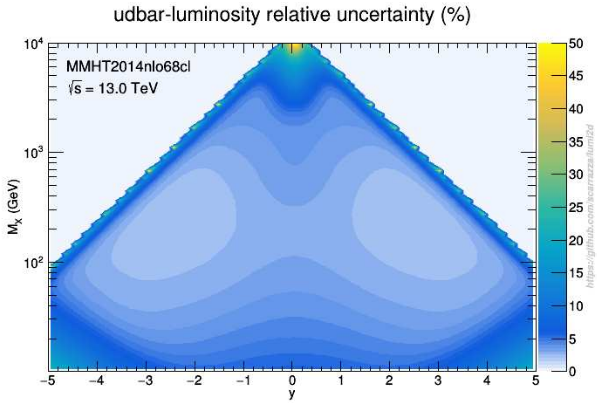


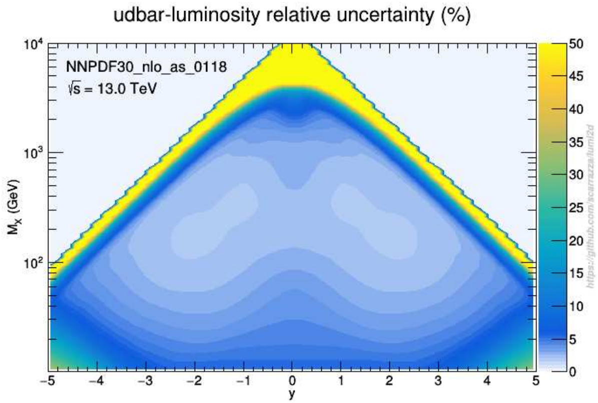




$u\bar{d}$





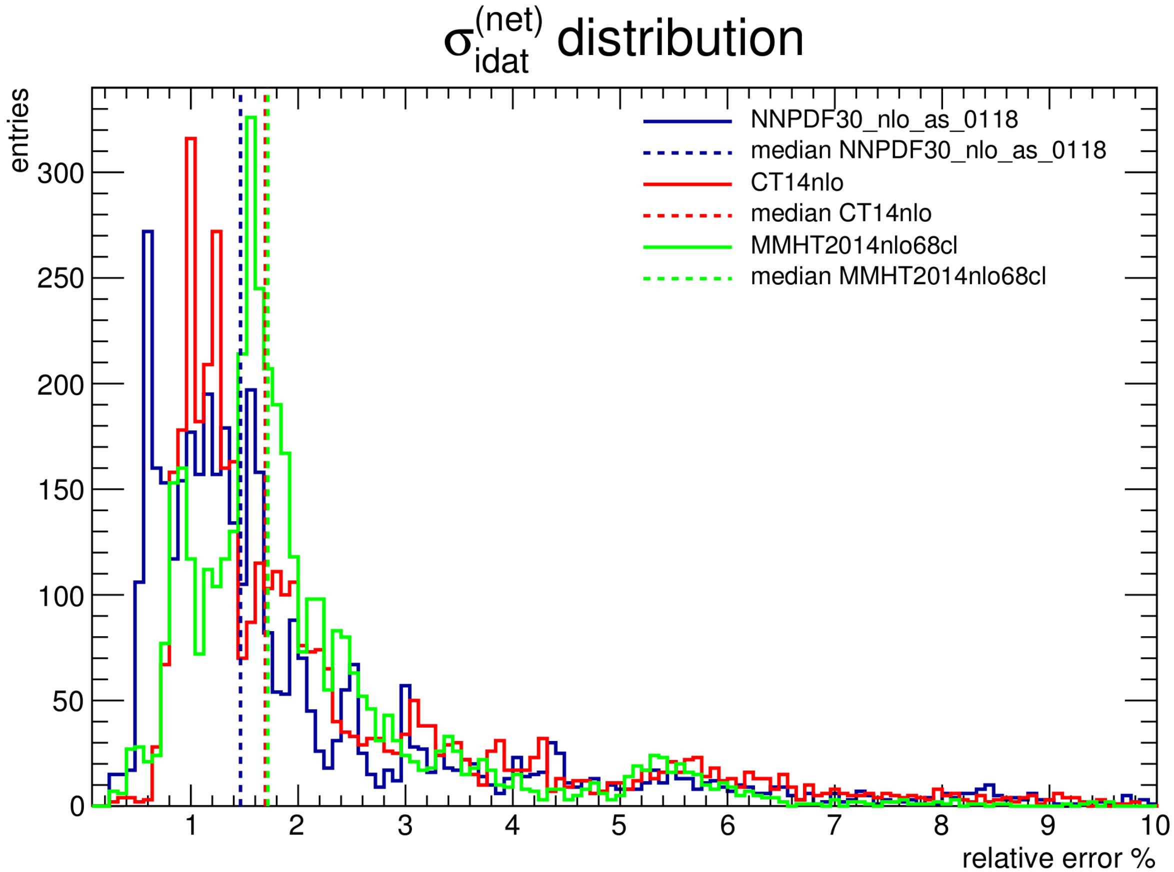


- DIFFERENCES IN UNCERTAINTIES BETWEEN GLOBAL FITS ALWAYS OF ORDER OF SEVERAL PERCENT
- UNCERTAINTY ON UNCERTAINTY SMALLER???

PDF UNCERTAINTIES: HOW MUCH DO THEY VARY?

- COMPUTE PERCENTAGE PDF UNCERTAINTY ON ALL DATA INCLUDED IN GLOBAL FIT
- COMPARE GLOBAL FITS

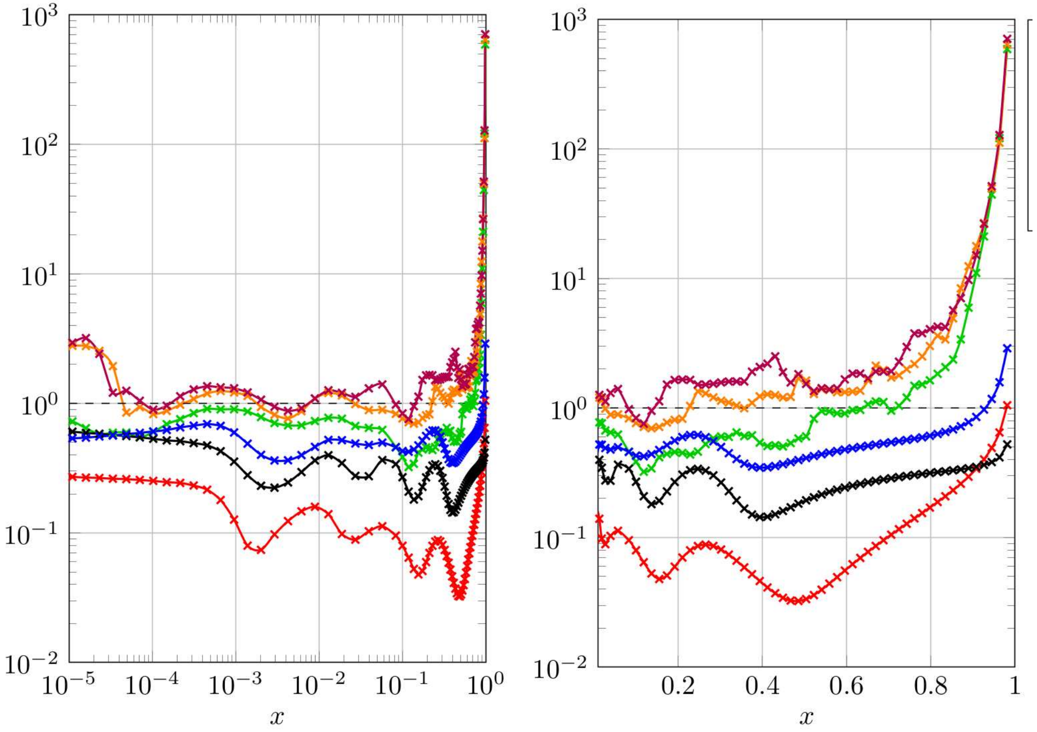
PERCENTAGE PDF UNCERTAINTY ON PREDICTIONS



- MEDIAN SIMILAR
- DISTRIBUTION VERY DIFFERENT!
- NNPDF: SMALLER MODE, BUT FAT TAIL $\Leftrightarrow$ GREATER FLEXIBILITY

WHY MORE FLEXIBLE IS BETTER

GLUON PDF UNCERTAINTY NORMALIZED TO MSTW08



(C. Mascaretti, 2016)

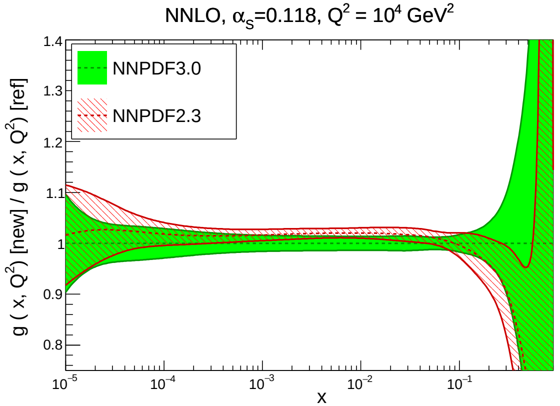
- CLOSURE TEST PERFORMED WITH DATA GENERATED BASED ON MST08 FUNCTIONAL FORM
- REFITTED EITHER WITH NNPDF OR MSTW FUNCTIONAL FORM
- LEVEL 0: VANISHING DATA UNCERTAINTY
  - MSTW-CT: FIT HAS ZERO UNCERTAINTY
  - NNPDF: ABOUT HALF OF TOTAL UNCERTAINTY
- LEVEL 1: NOMINAL DATA UNCERTAINTY, BUT REPLICAS FITTED W/O PSEUDODATA
  - MSTW-CT: FIT HAS SMALL UNCERTAINTY
  - NNPDF: ABOUT 2/3 OF FINAL UNCERTAINTY
- LEVEL 2
  - NNPDF UNCERTAINTY LARGER THAN MSTW-CT
  - NNPDF UNCERTAINTY SIMILAR TO TRUE MSTW

WHY MORE FLEXIBLE IS MORE DANGEROUS
NNPDF: 3.0 VS. 2.3

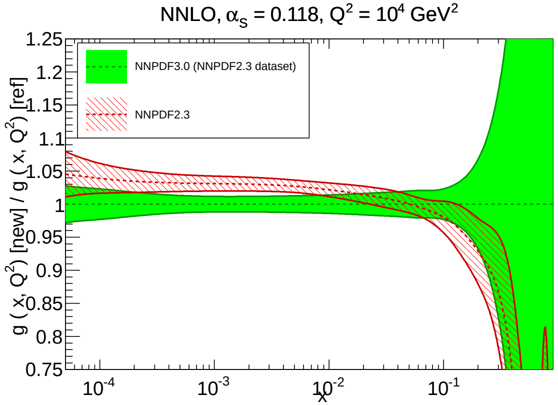
- REPEAT THE 3.0 FIT BUT WITH 2.3 DATASET
- COMPARE WITH 2.3 DATA & METHODOLOGY; 2.3 DATA BUT 3.0 METHODOLOGY; 3.0 DATA & METHODOLOGY

THE GLUON DISTRIBUTION

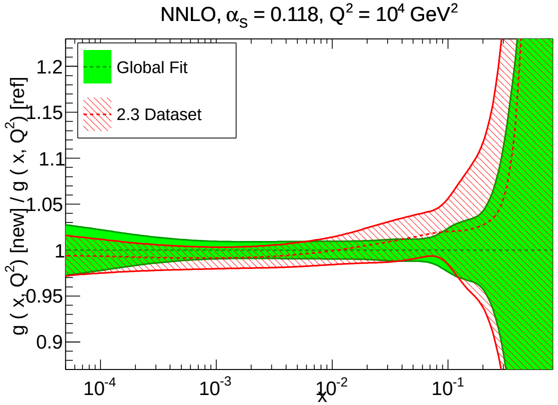
DEFAULT 3.0 VS DEFAULT 2.3



DEFAULT 2.3 VS. 2.3 DATA



DEFAULT 3.0 VS 2.3 DATA



- MAIN METHDOLOGICAL DIFFERENT: MORE EFFICIENT GENETIC MINIMIZATION
- THE METHODOLOGY HAS A DOMINANT EFFECT ON THE GLUON

CAN LHC RUN II DATA DATA HELP?

- DATA AT HIGHER CM ENERGY & INFO ON CORRELATION TO LOW ENERGY
  $\rightarrow$ EXTENDED KINEMATIC COVERAGE & REDUCED SYSTEMATICS

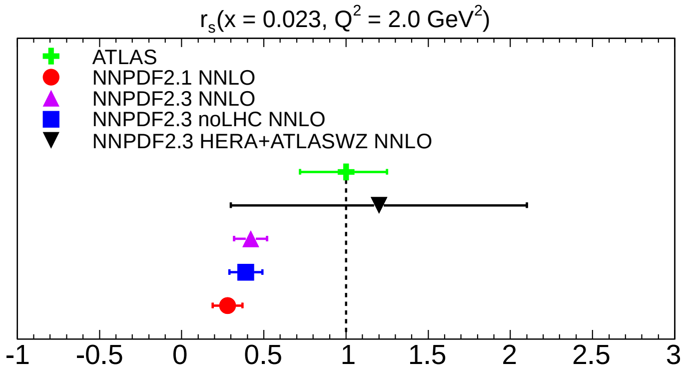
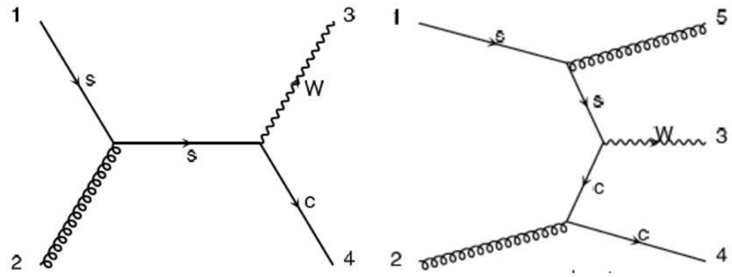
NOT VEY MUCH, IF EVERYTHING IS CONSISTENT

HOW LHC DATA MIGHT HELP

STRANGENESS & W PRODUCTION





- ATLAS INCLUSIVE W PRODUCTION DATA (2012) SUGGEST LARGE (≈ 1) STRANGE FRACTION $r_s(x, Q^2) = \frac{s(x,Q^2)+\bar{s}(x,Q^2)}{2\bar{d}(x,Q^2)}$
- HOWEVER LARGE UNCERTAINTIES (NNPDF2.3) $\Rightarrow$ CONSISTENT WITH PREVIOUS DET. (FROM NEUTRINO DATA) WITHIN UNCERTAINTIES
- STRANGENESS PROBED DIRECTLY IN $W + c$ PRODUCTION

$W + c$ PRODUCTION AT THE LHC

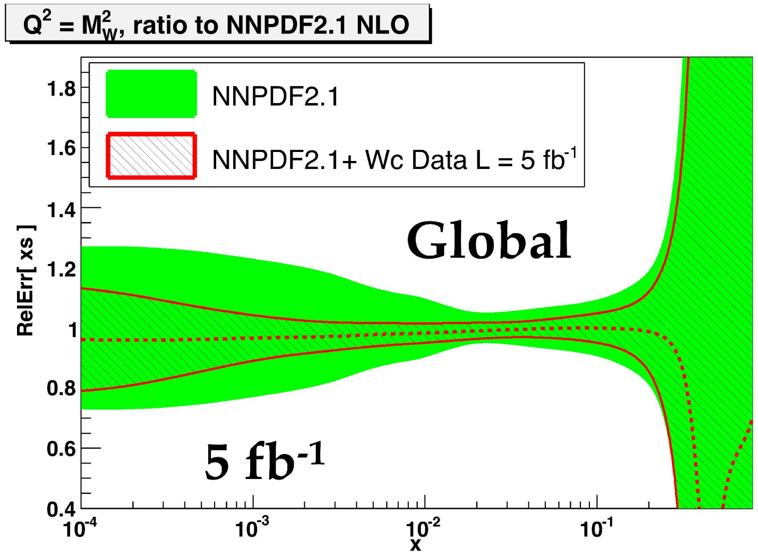
- SIMULATED MEASUREMENT OF c RAPIDITY DISTRIBUTION WITH AMC@NLO

(J. Rojo, S. Frixione, M. Mangano, 2012)

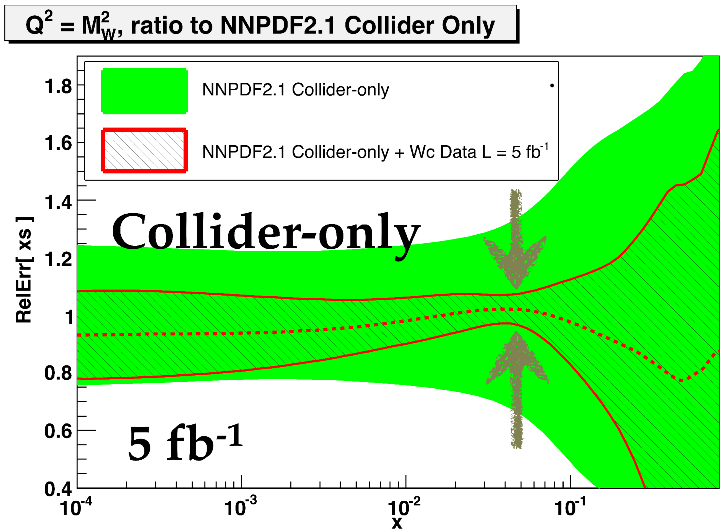
- CMS KINEMATICS $p_T^{\rm jet} > 20$ GeV, $p_T^{\mu} > 25$ GeV $\eta^{\rm jet}$, $\eta^{\mu} < 2.1$
- 15% CHARM TAGGING EFFICIENCY (CMS)
- CURRENTLY 36 PB^{-1}, BUT 5 FB^{-1} SUFFICIENT

THE IMPACT ON STRANGENESS

IN THE NNPDF2.1 FIT



IN THE COLLIDER-ONLY FIT



$W + c$ production at the LHC

- measurements by ATLAS and CMS consistent within uncertainties
- compare to available default fits & to NNPDF "collider only" fit (no neutrino data) $\Rightarrow$ tension between DY and neutrino data
- ATLAS central vaue favors DY measurement, CMS central value favors neutrino data

THE ROLE OF NEW DATA:
LESSONS LEARNT

- MISTRUST ASSESSMENTS OF THE IMPACT OF NEW DATA X BASED ON A HERA+X FIT
- NEW DATA ARE UNLIKELY TO REDUCE UNCERTAINTIES IF CONSISTENT WITH EXISTING DATA, BUT MAY HAVE A SIZABLE IMPACT IF NOT CONSISTENT WITH THEM
- NEW DATA CAN HELP IN LEAVING BEHIND DATA BASED ON OBSOLETE PHENOMENOLOGY OR LESS RELIABLE THEORY:
  - OLD FIXED TARGET DIS DATA
  - DIS AND DY DATA ON NUCLEAR (DEUTERIUM) TARGETS
  - NEUTRINO DIS DATA (ALL ON NUCLEAR TARGETS)

LHC DATA CAN HAVE A SIGNFICANT IMPACT ON FLAVOR SEPARATION

VERY IMPORTANT FOR NEW PHYSICS SEARCHES

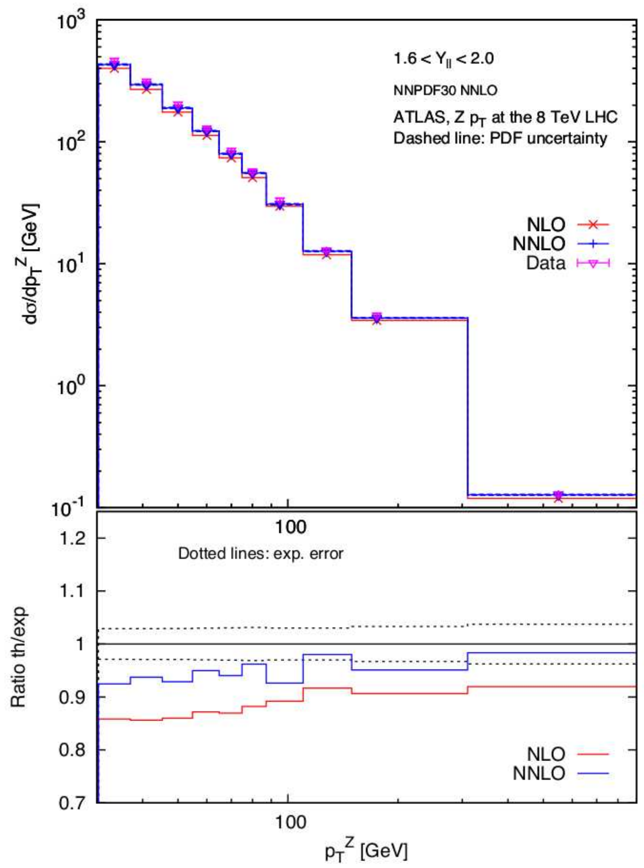
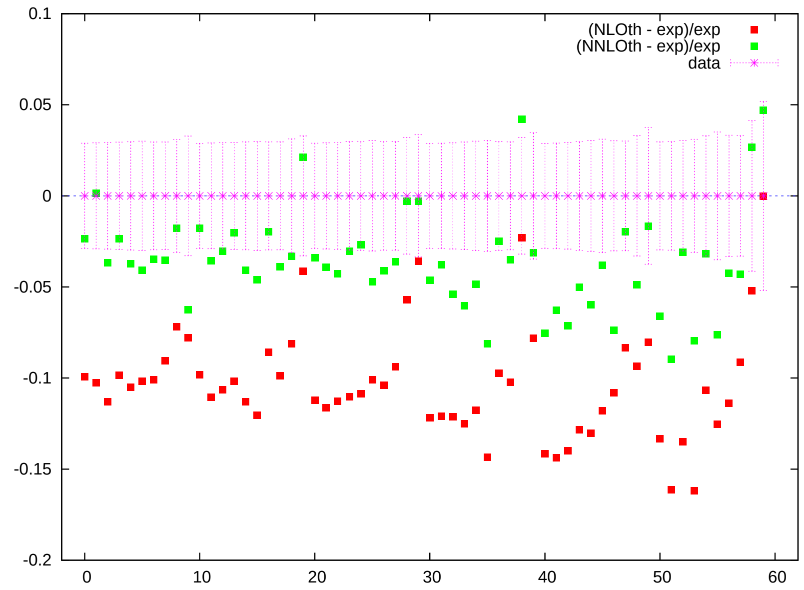
Z TRANSVERSE-MOMENTUM DISTRIBUTIONS: PROBLEMS

ATLAS 8TEV & NNPDF3.0: DATA VS. THEORY

CENTRAL RAP.





- DIFFICULT TO FIT 8 TeV DATA
- NO IMPROVEMENT IN χ^2 AT NORMALIZED LEVEL
- CORRELATED SYSTEMATICS DOMINANT $\Rightarrow$ NLO $\chi^2 = 5.7$, NNLO $\chi^2 = 6.2$
- POORLY-CONDITIONED COVARIANCE MATRIX: EIGENVALUES SPAN SEVERAL ORDERS OF MAGNITUDE $\Rightarrow$ NEED UNCERTAINTY ON COVARIANCE MATRIX?
- DO WE CONTROL NNLO TO 1%?

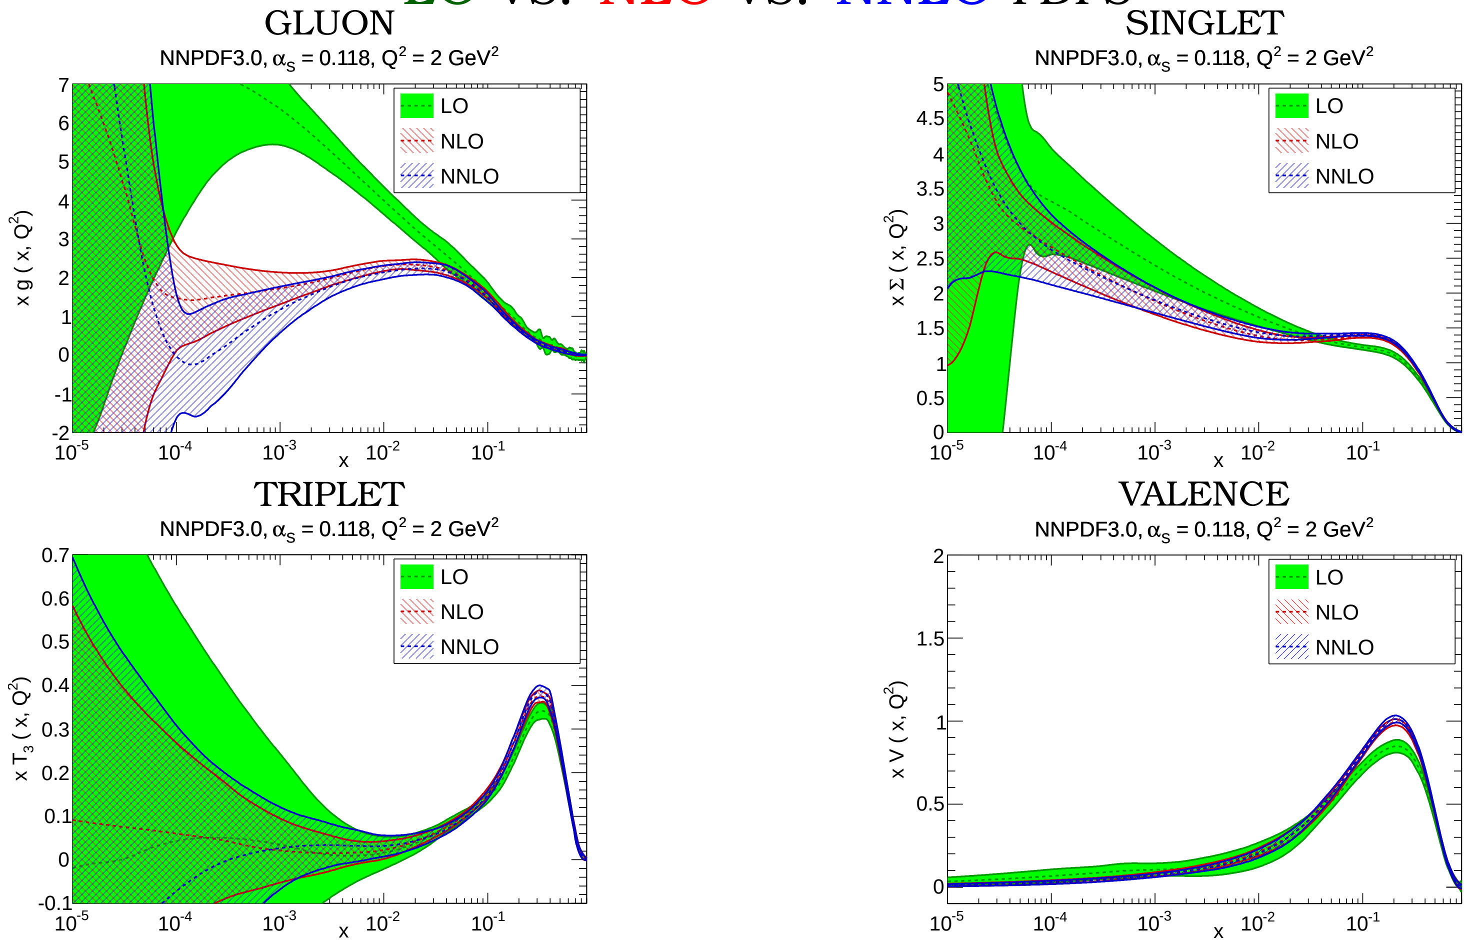
COLLIDER PDFs:

LESSONS LEARNT

- COLLIDER PDFs ARE BEHIND THE CORNER
- CORRELATED SYSTEMATICS DOMINATE THE UNERTAINTY
- MUST CONTROL POINT-TO-POINT FLUCTUATIONS (INCLUDING NNLO CORRECTIONS) TO BETTER THAN 1%
- MUST ACCOUNT FOR THE UNCERTAINTY ON THE COVARIANCE MATRIX

NEW PROBLEMS

PERTURBATIVE STABILITY I
LO VS. NLO VS. NNLO PDFS



- PERTURBATIVE ACCURACY OF PREDICTION LIMITED BY PERTURBATIVE ACCURACY OF PDF
- $\alpha_s(M_z) \sim 0.1,\ \alpha_s(M_p) \sim 1/2;\ \alpha_s(Q_1^2) = \alpha_s(Q_2^2)(1 + O(\alpha_s^2))$

THEORETICAL UNCERTAINTIES:

LESSONS LEARNT

- THEORETICAL UNCERTAINTIES ARE NO LONGER SUBDOMINANT
- PDF UNCERTAINTIES SHOULD INCLUDE SOME ESTIMATE OF MHOU
- THE CHOICE OF HEAVY QUARK MASS VALUES MAY HAVE SIGNIFICANT EFFECTS
- HEAVY QUARK MASS VARIATION SHOULD BE PERFORMED
- FITTED CHARM PDF LEADS TO INCLUSION OF MASS UNCERTAINTY INTO PDF UNCERTAINTY
