## **Khronometric Theory, Numerical General Relativity and Blackholes**

*Thursday, 12 January 2017 11:25 (25 minutes)*

In Khronometric theory we break Lorentz invariance by introducing a preferred time direction, and hence, equipping our spacetime manifold with a foliation of space-like surfaces. Our primary tool to solve the equations of motion in such a spacetime is Numerical General Relativity (NGR). We investigate how we can use this tool, to solve the equations of motion for a blackhole solution in Khronometric Theory.
