

# Renormalised vacuum polarisation on topological black holes

*Thursday, December 20, 2018 11:50 AM (20 minutes)*

Anti-de Sitter spacetime is a solution of Einstein's equations with a negative cosmological constant. This fact allows for unusual black hole solutions with non-spherical horizon topology. We calculate the renormalised vacuum polarisation for black holes with spherical, flat and hyperbolic event horizons, following the "extended coordinates" method, which uses a mode-sum representation for the Hadamard parametrix. Renormalisation counter terms are subtracted from the Green's function mode-by-mode, leaving each individual term manifestly finite.
