## Flavour Anomalies: Hints for BSM physics in expected and unexpected places

*Tuesday, 29 June 2021 12:50 (50 minutes)*

Quark flavour physics has received a lot of attention over the last decade. The influx of attention is driven by the so-called flavour anomalies: a series of statistically significant tensions between Standard Model predictions and measurements, shy of the celebrated 5 sigma significance. I will review the status of the so-called “b anomalies”, a subset of the flavour anomalies, and provide context for the theoretical information required for their interpretation.

**Presenter:** VAN DYK, Danny (TU München)

**Session Classification:** Flavour phenomenology
